- As mentioned in previous meetings recently a paper was posted on arXiv and sent to JINST.
- This presentation does a quick review of the paper.

- In HEP, often one can measure the response of a detector, but modeling it is difficult. E.g the ToF detector we are preparing for the ND280 upgrade

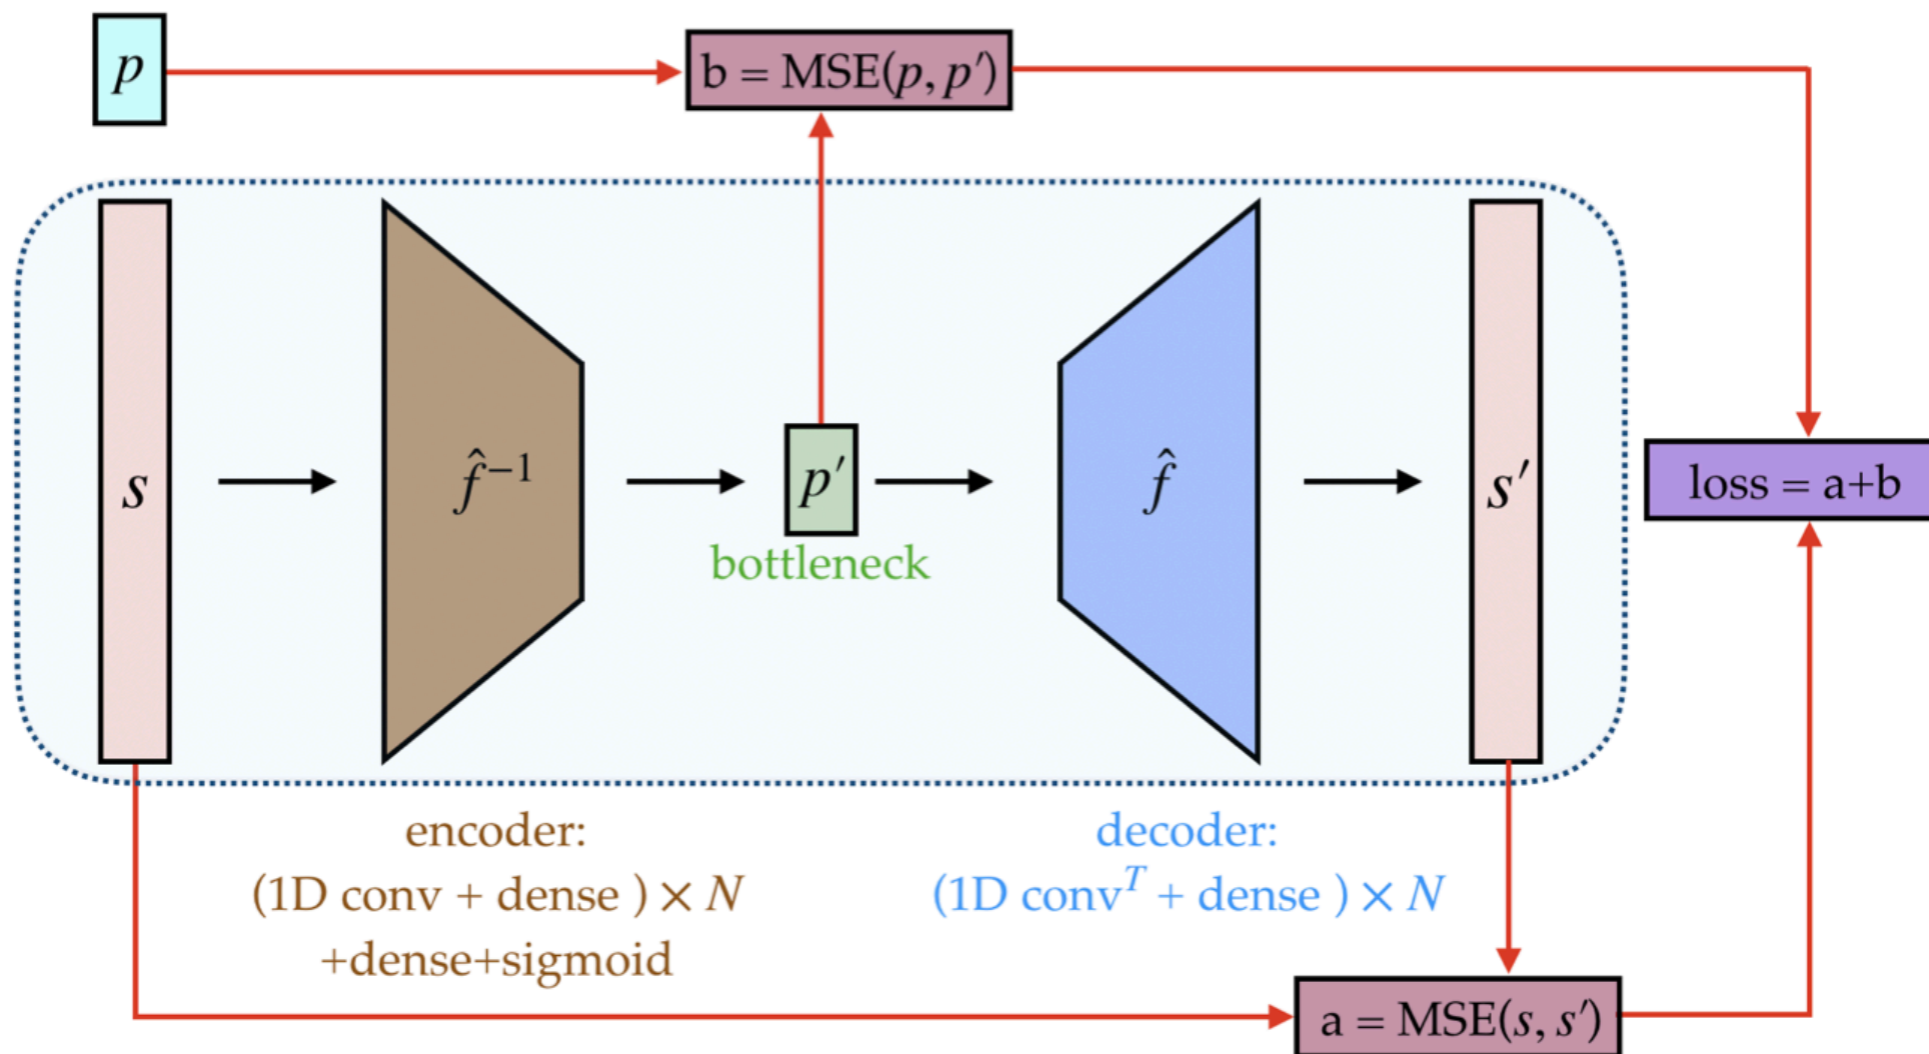

Introduction

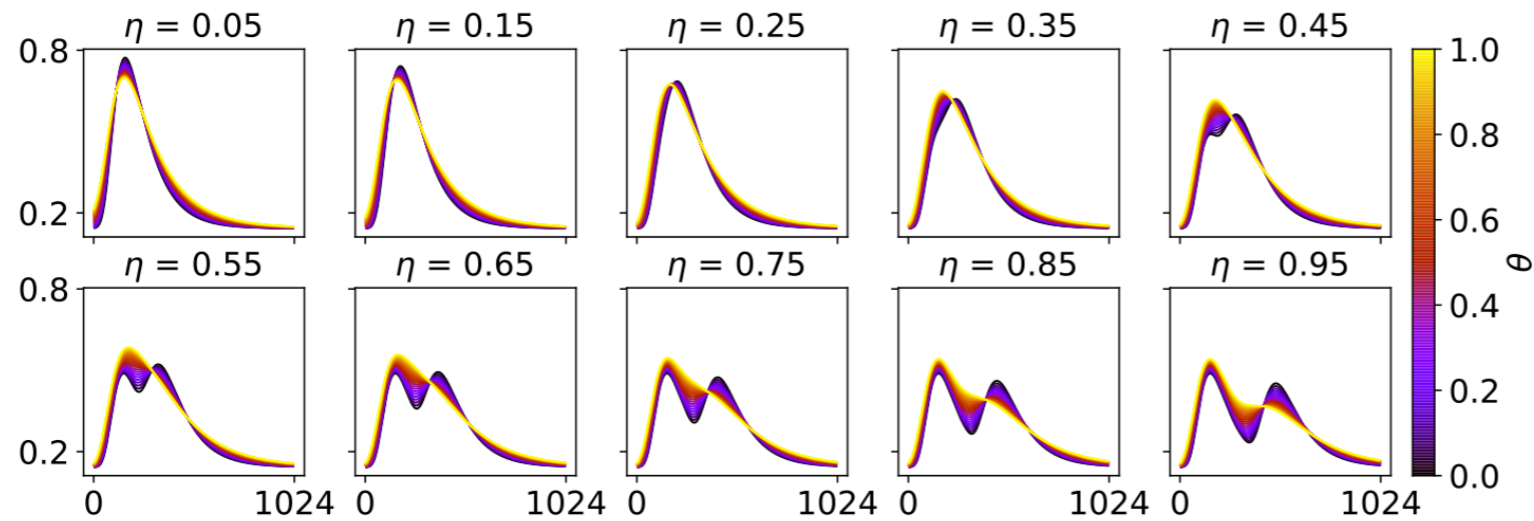

- We can measure the typical signals for all distances. We can learn this relation directly from data?

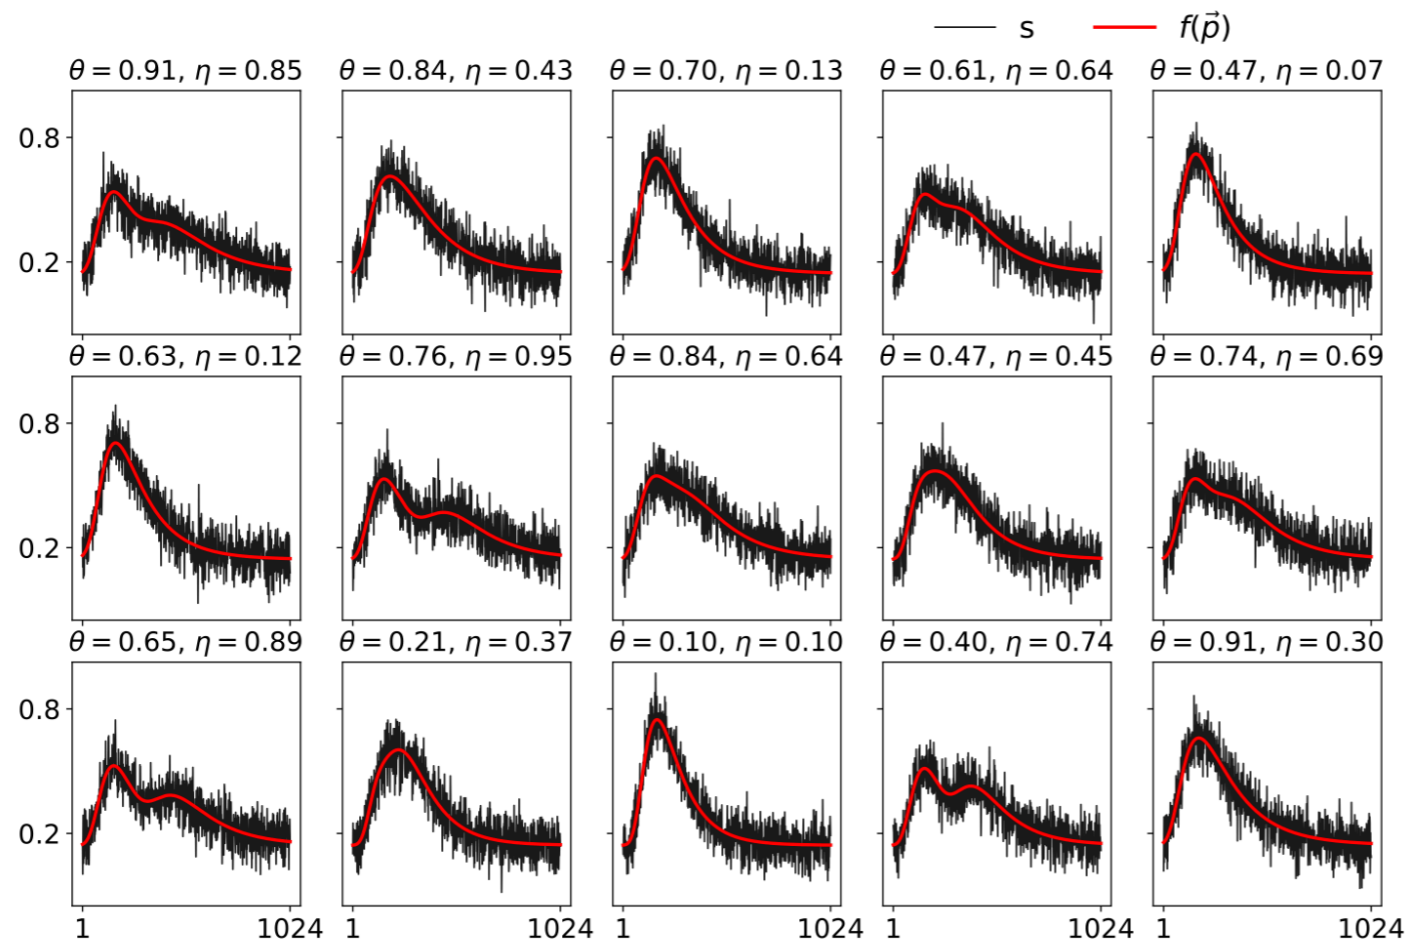

The idea:

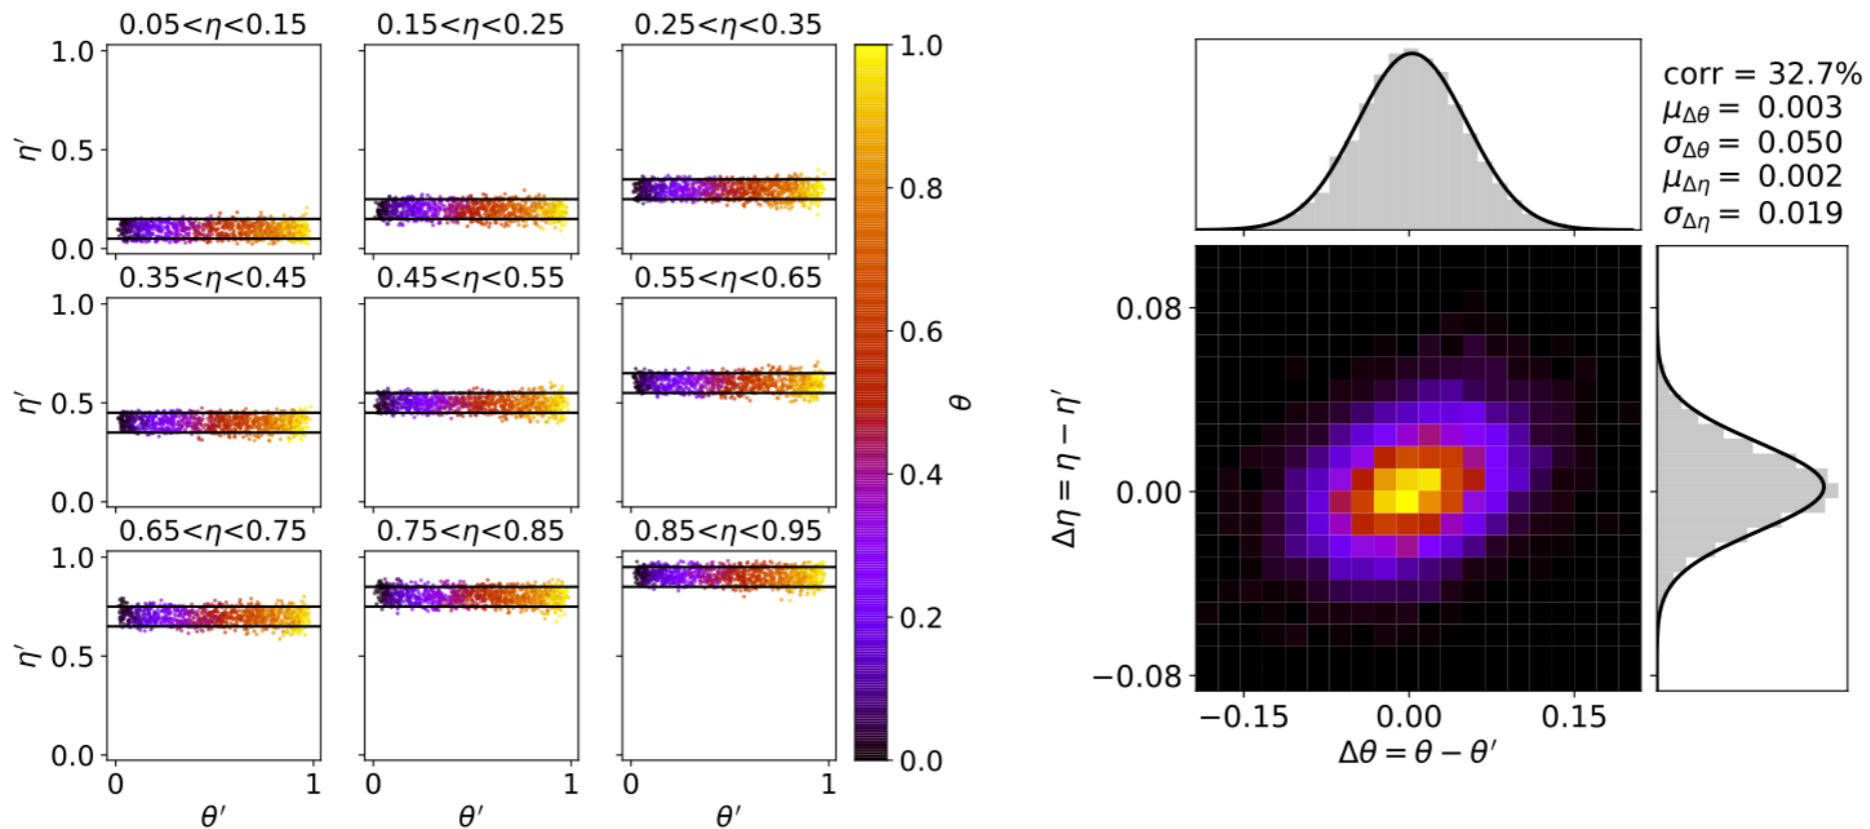

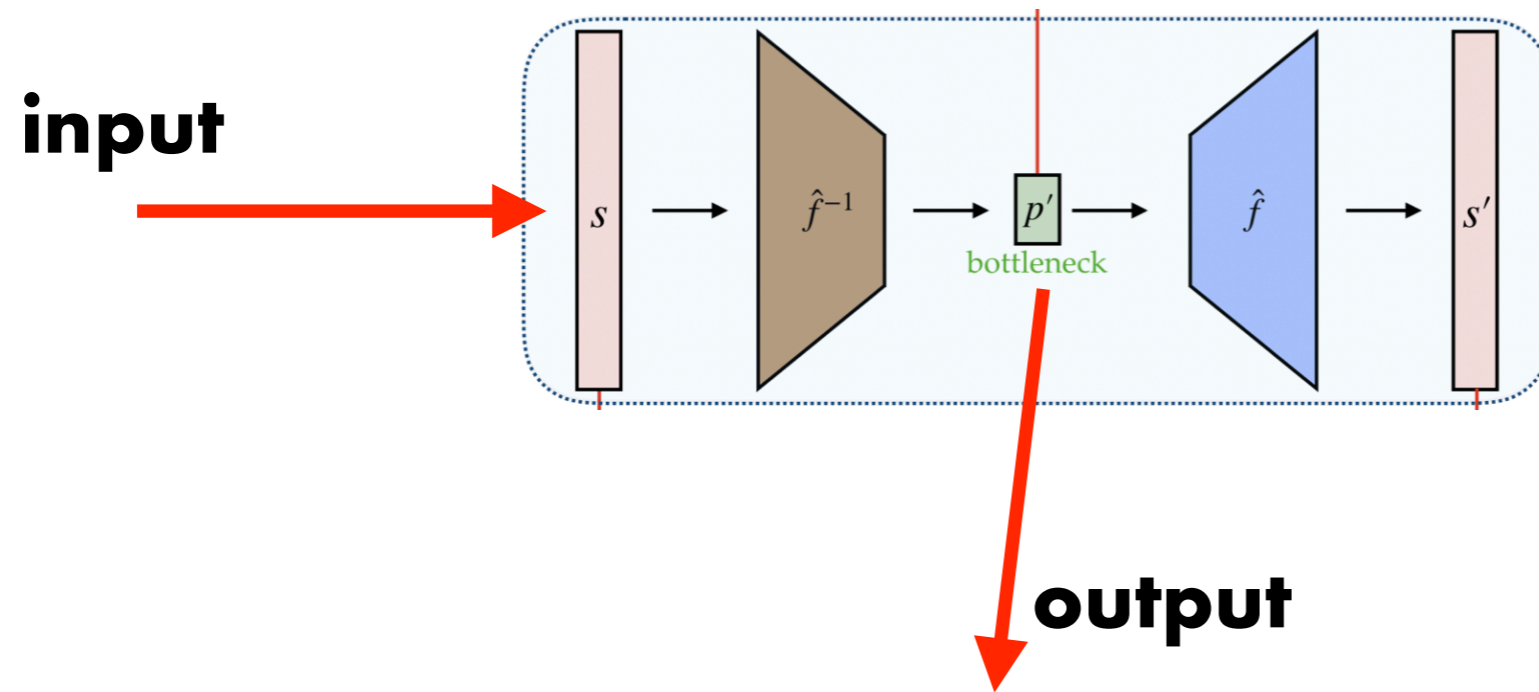

- Create a function (toy model) to generate synthetic data:

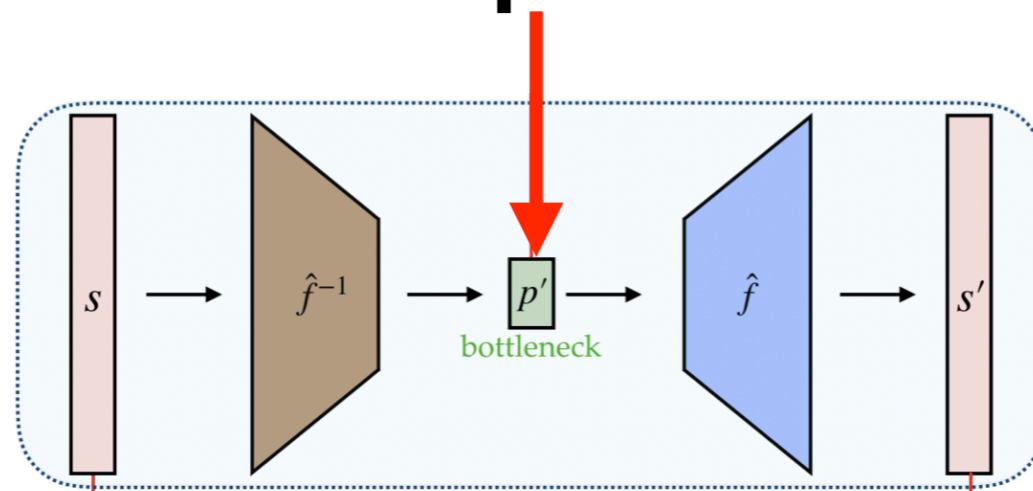

- Add noise:

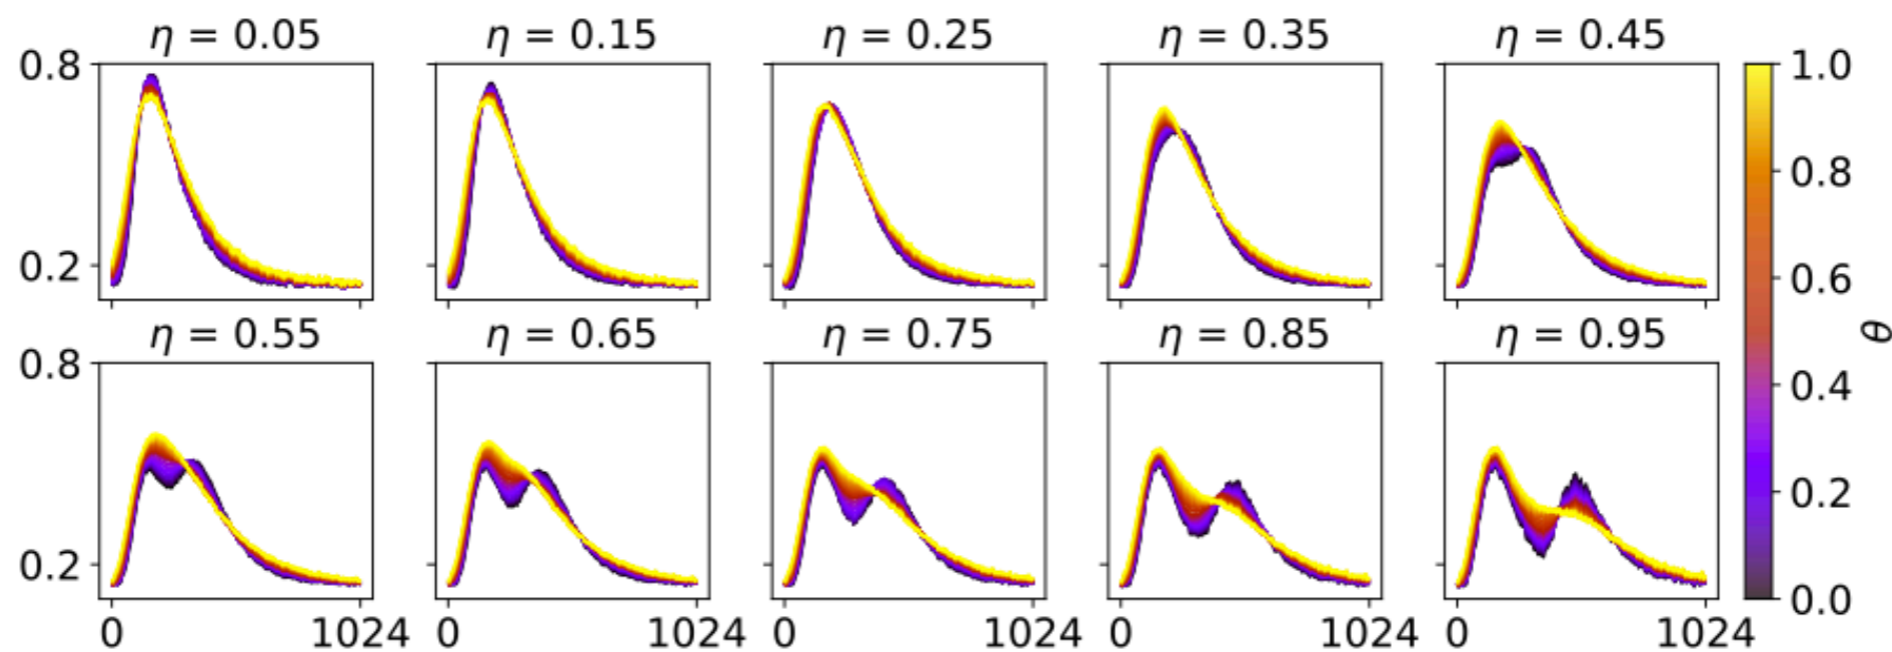

and train!

input

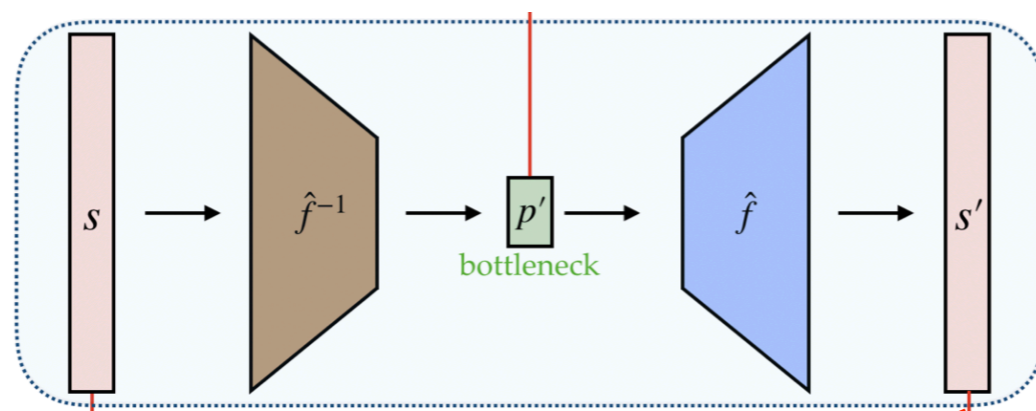

output

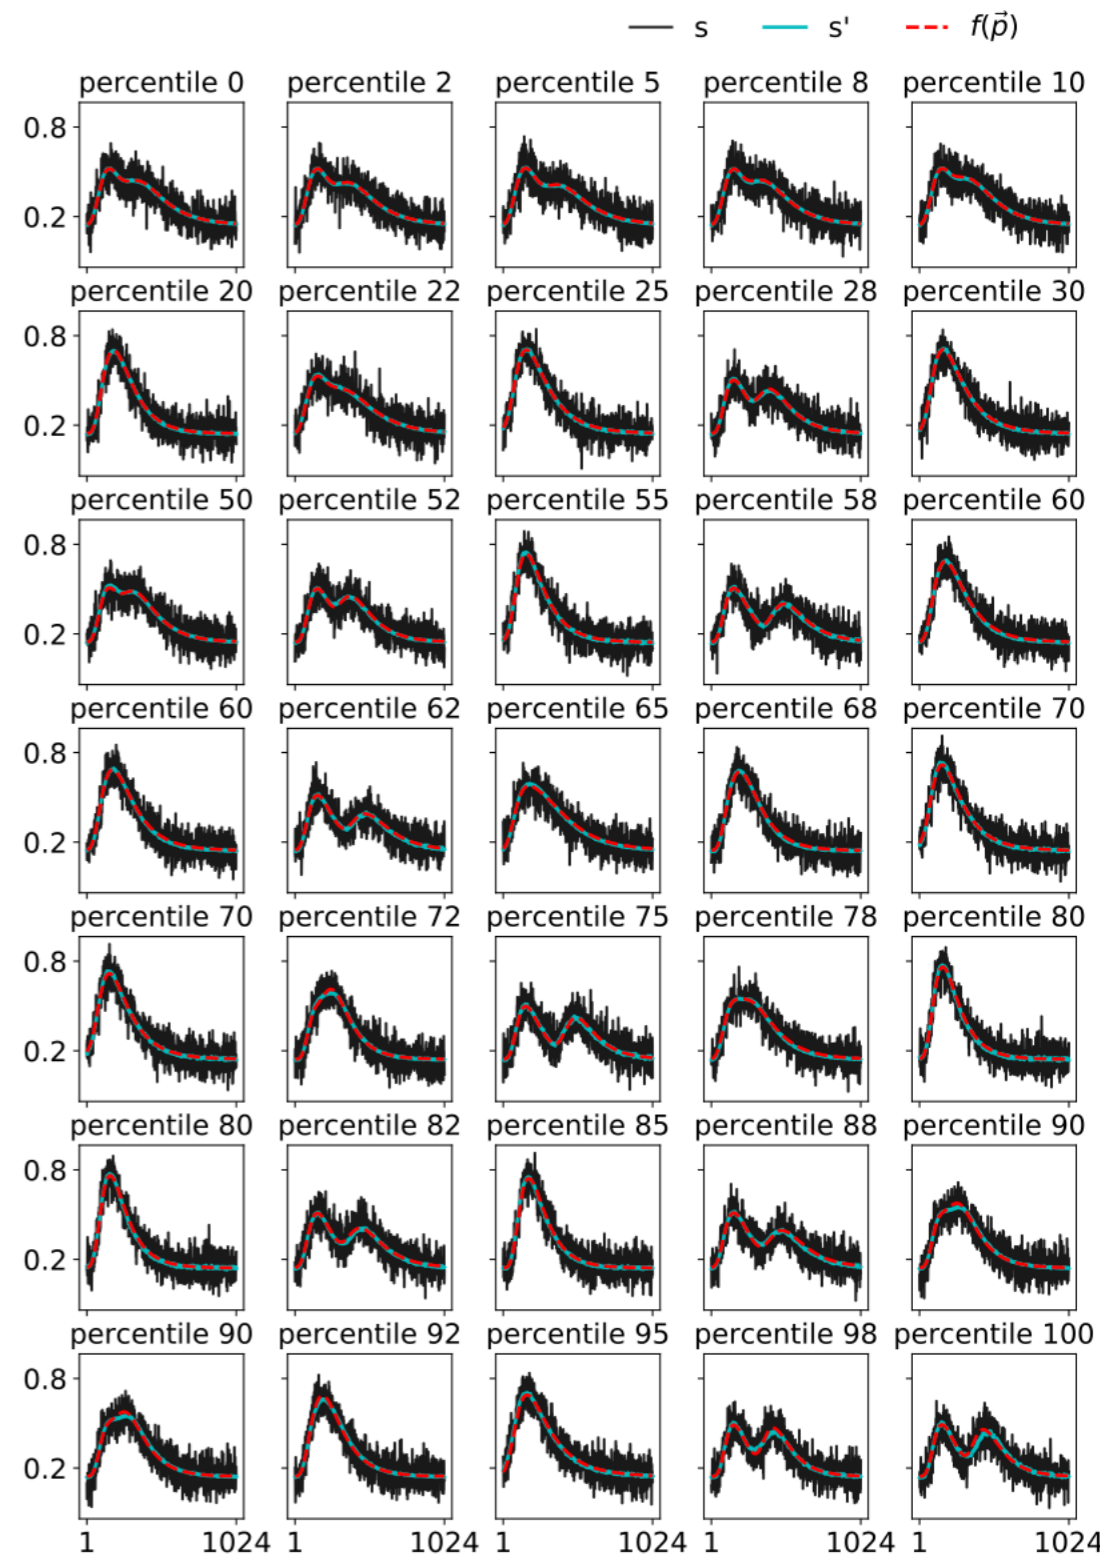

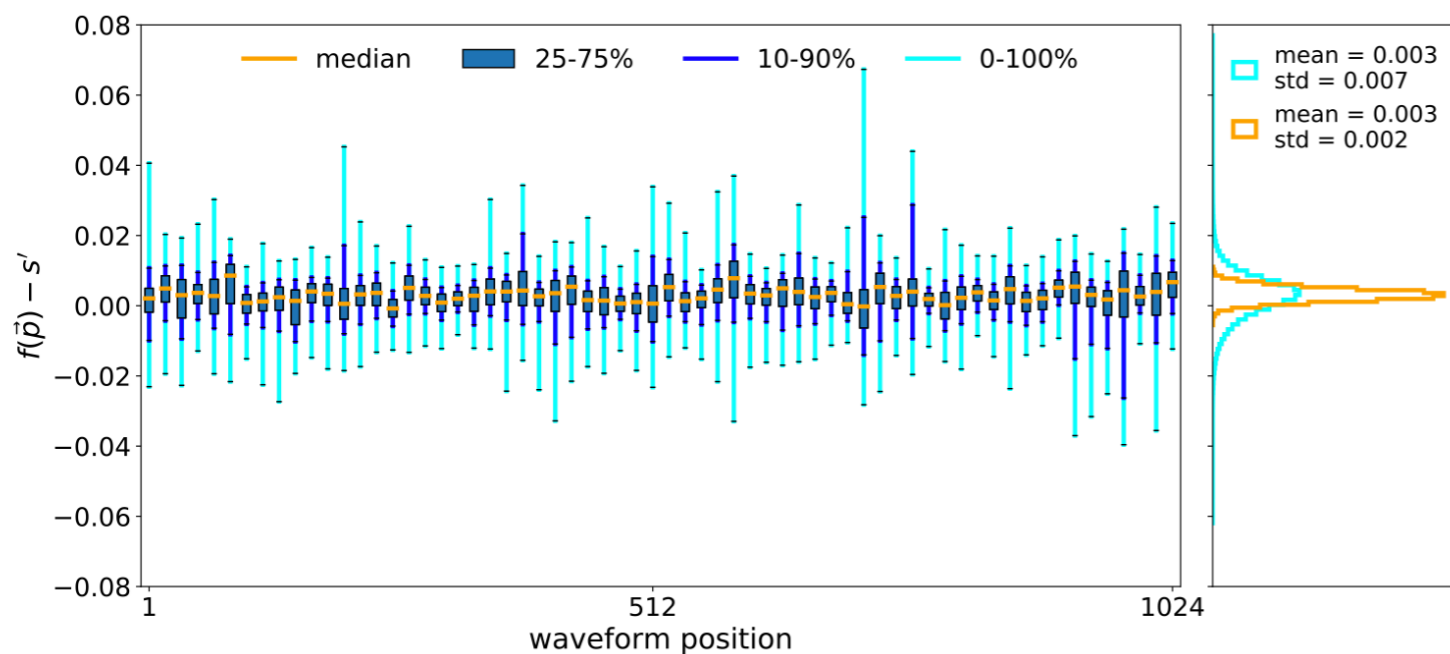

Results

input

output

- The algorithm shows very good performance.
- It can be used (potentially) for a very large number of problems.
- Got only minor comments from JINST, which I expect to address this week.
