# ML (e/gamma) studies in WCTE

**D. Costas-Rodríguez, J. Renner, J. A. Hernando-Morata**  
**IGFAE/Universidade de Santiago de Compostela**  
*HyperK physics Workshop at DIPAC, June 14, 2023*

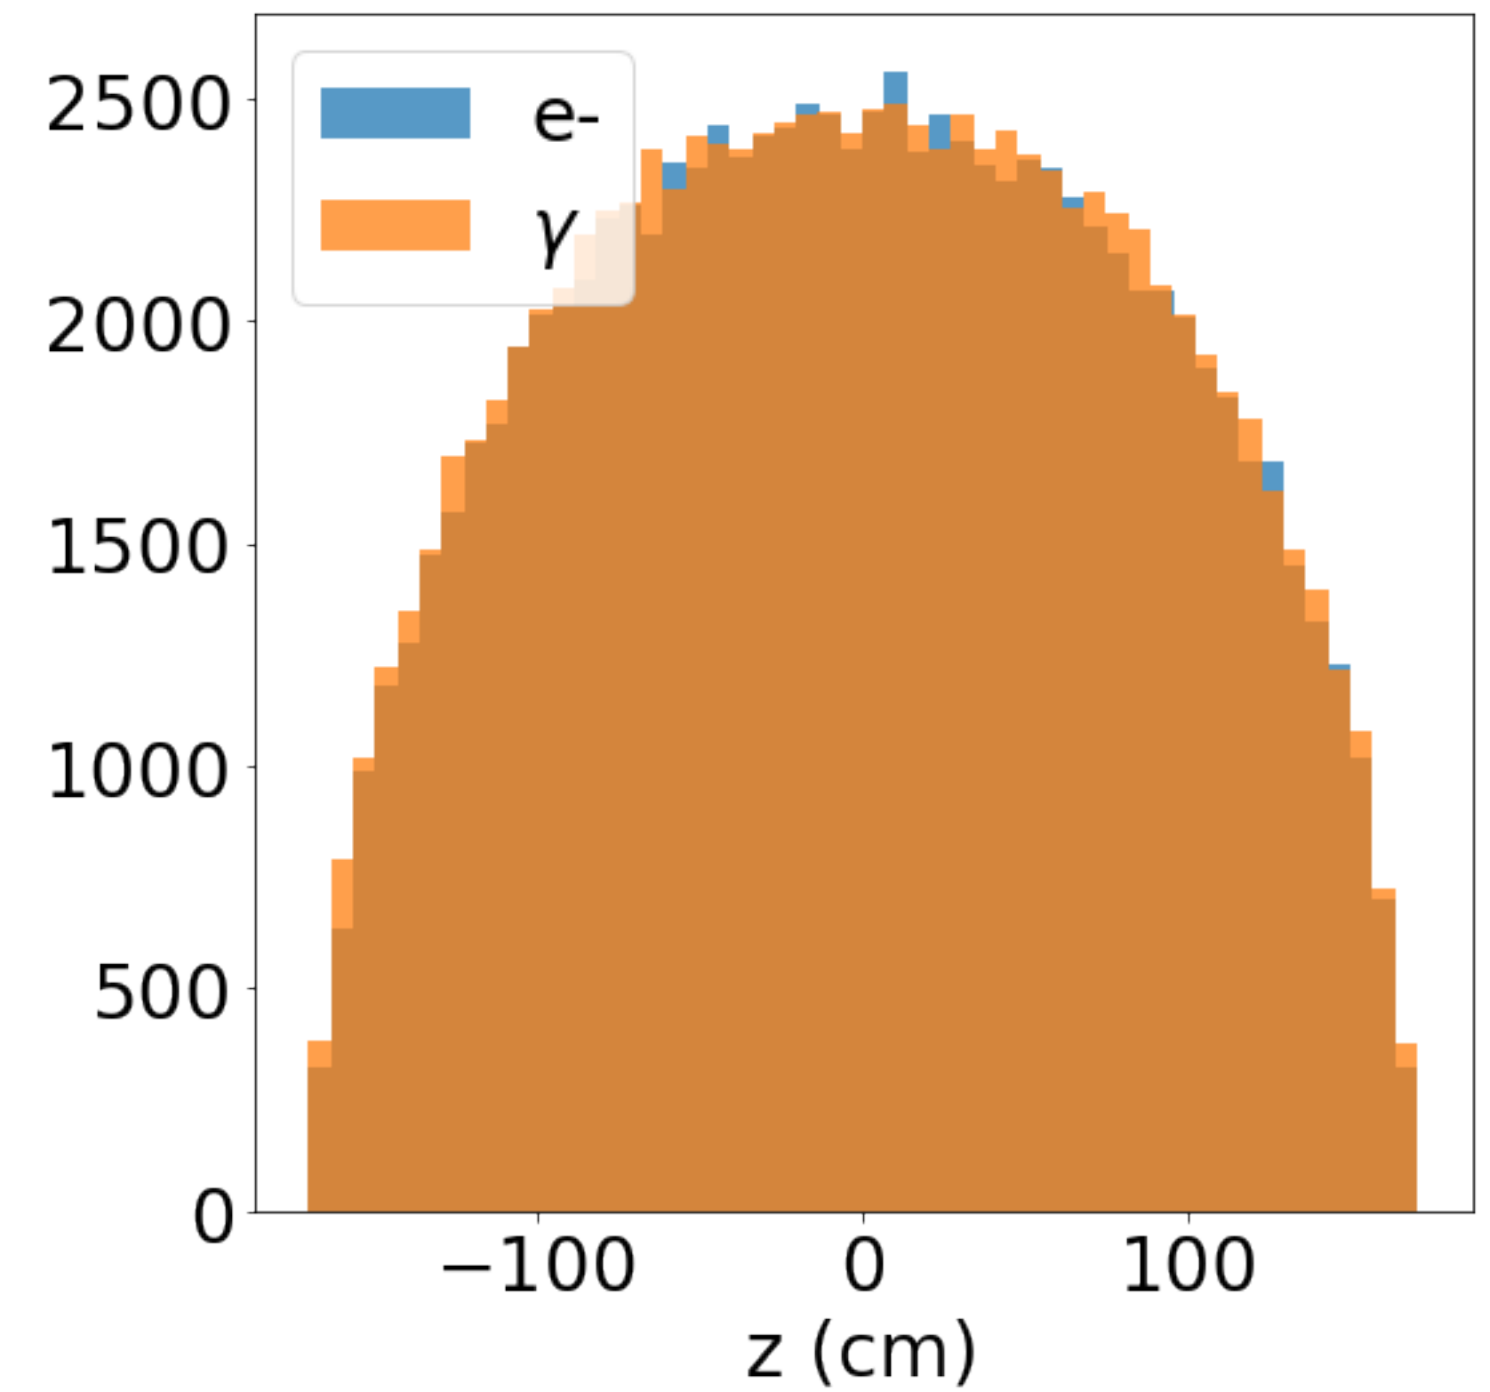

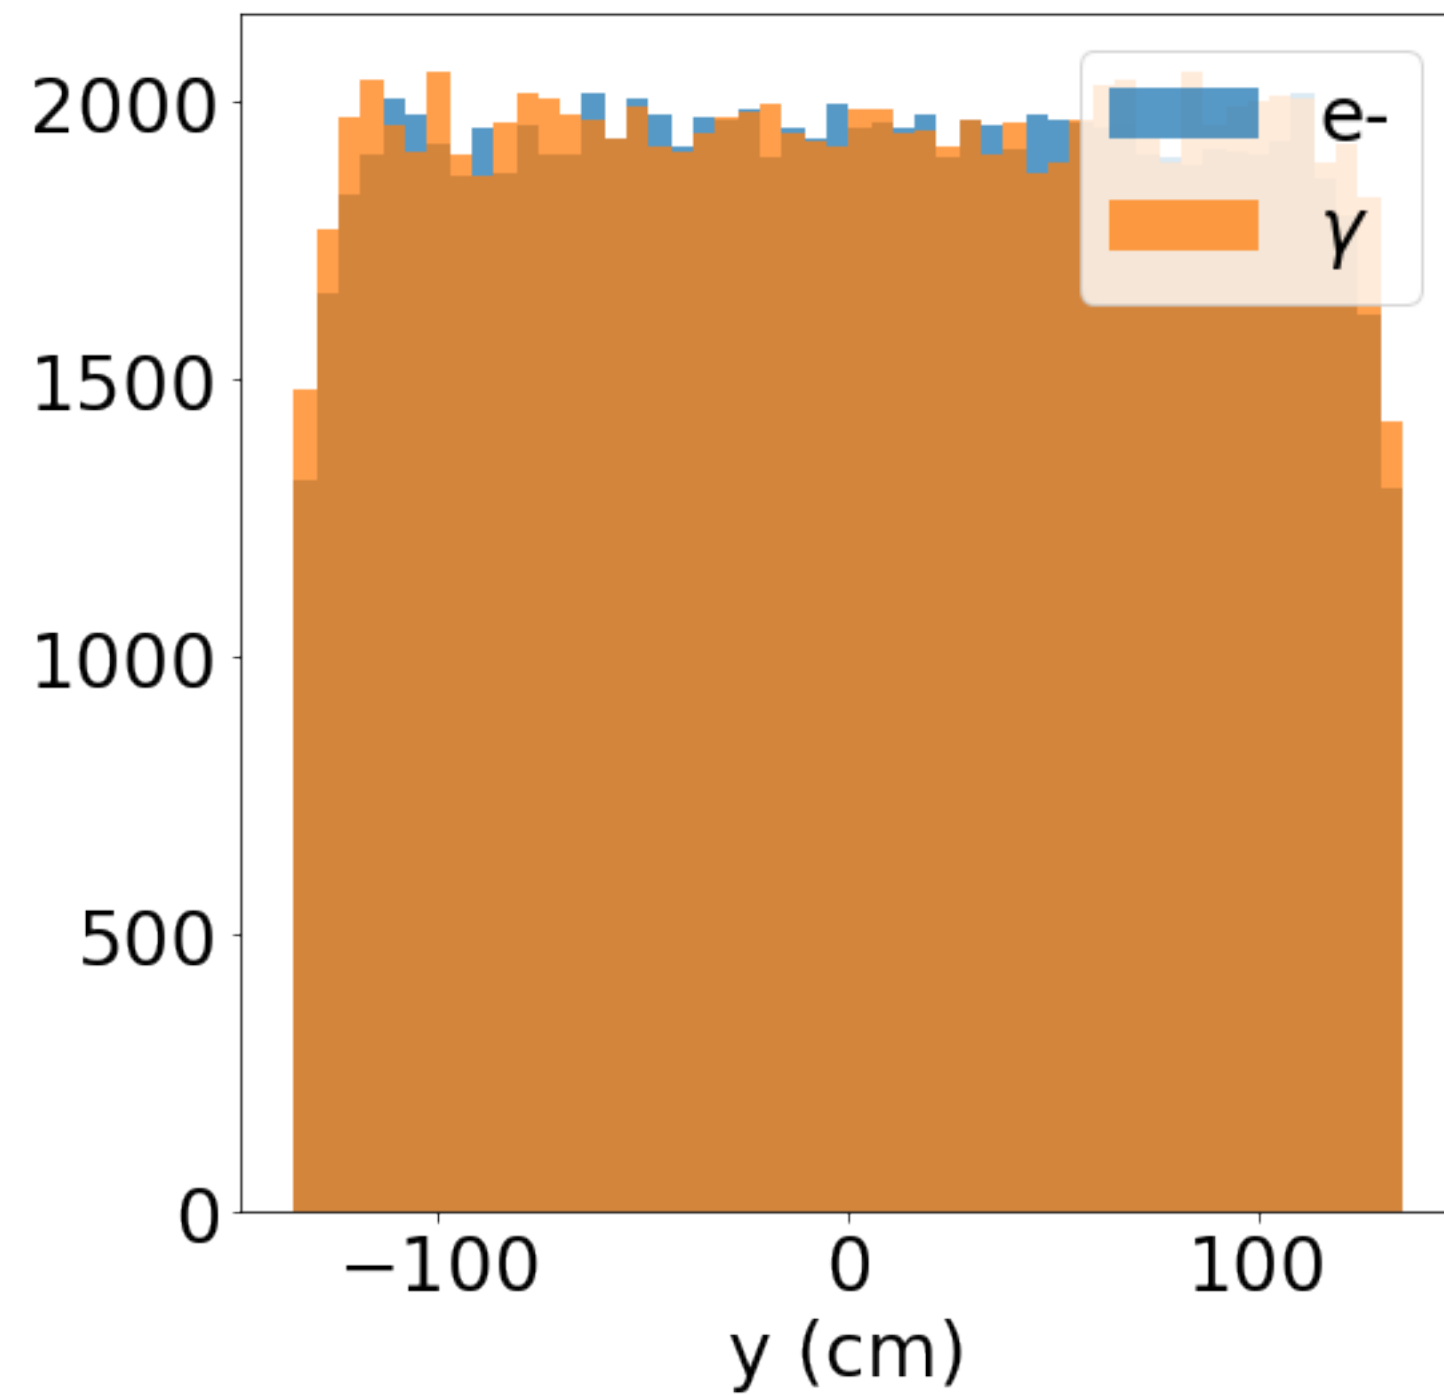

# Summary:

- e-/mu- separation shown in previous studies to be good
- Recent efforts largely focused on e-/gamma separation
  - ▶ Using notebook from Nick Prouse: <https://github.com/nickwp/watchmal-examples/blob/master/IWCD> PID example analysis of single ResNet run.ipynb
  - ▶ ResNet with hit charge + timing information (from Annalisa <https://github.com/adelorenzis/WatChMaL>)
  - ▶ Using updated branch nuPRISM/develop in WCTE/WCSim (<https://github.com/WCTE/WCSim>)

## Generation of WCSim events (1M e-/gamma):

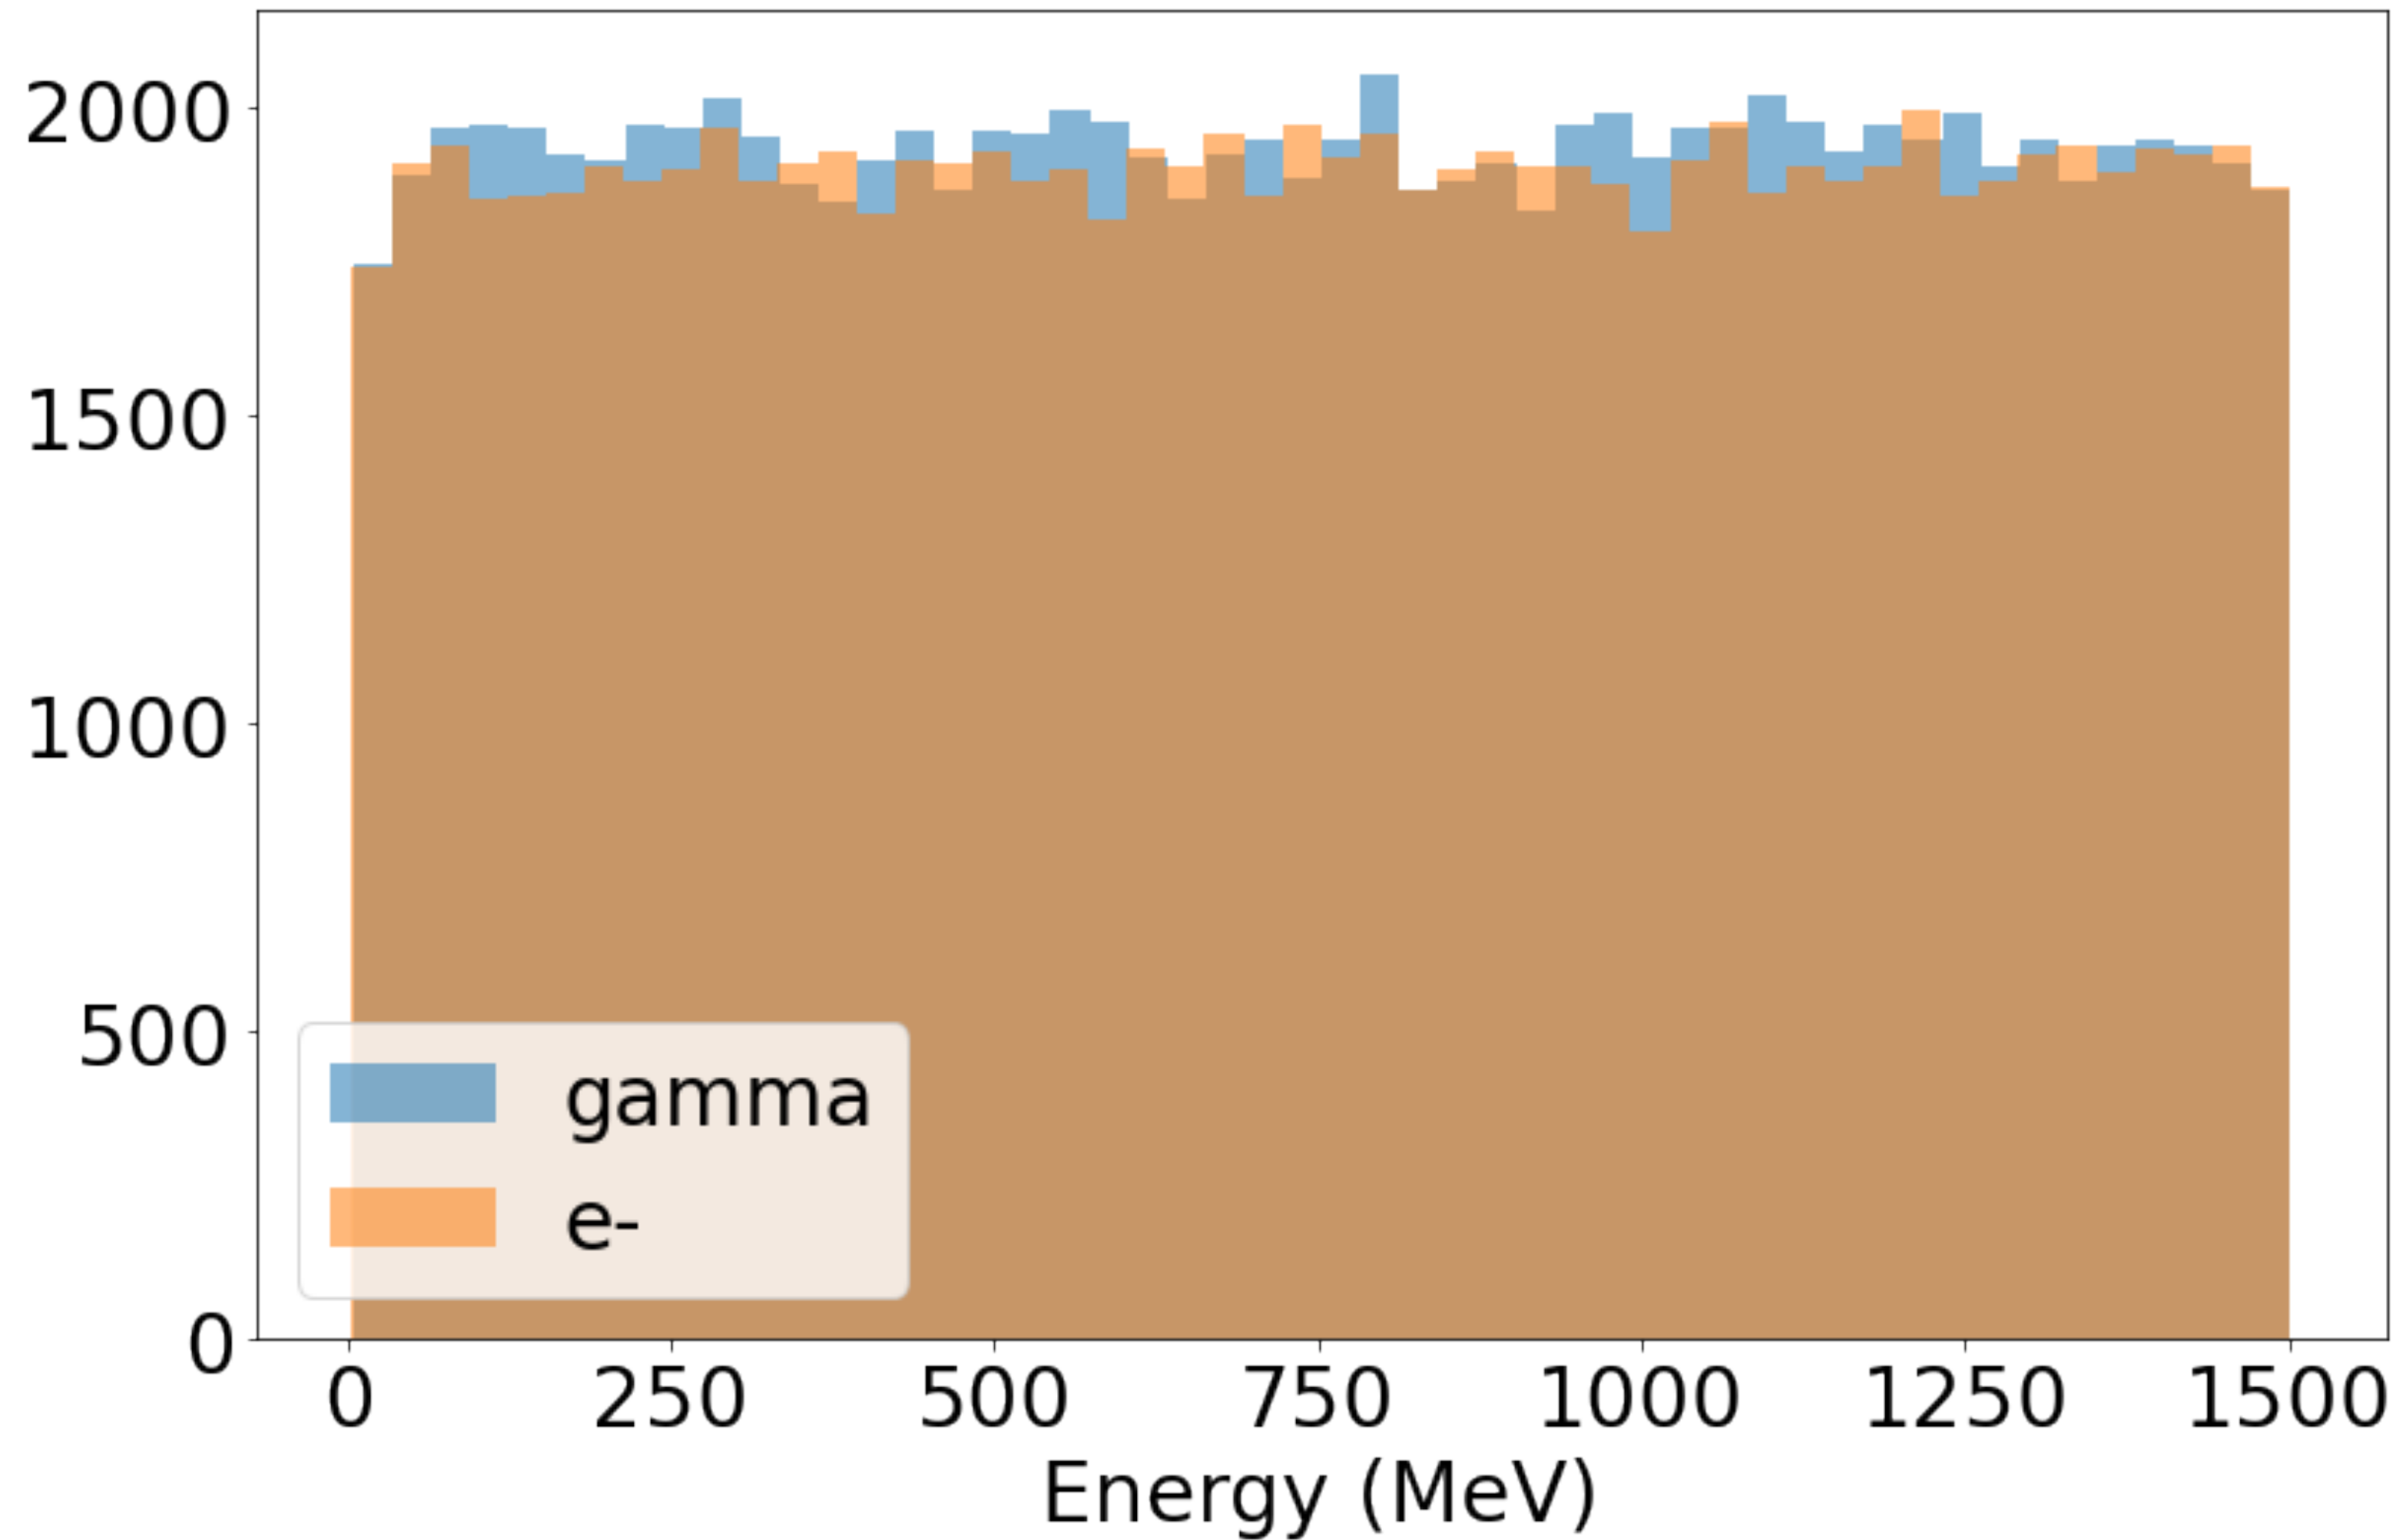

- Axis of cylinder is along Y: events launched from  $[-\text{height}/2, +\text{height}/2]$

### Distribution of initial (x,y,z) locations

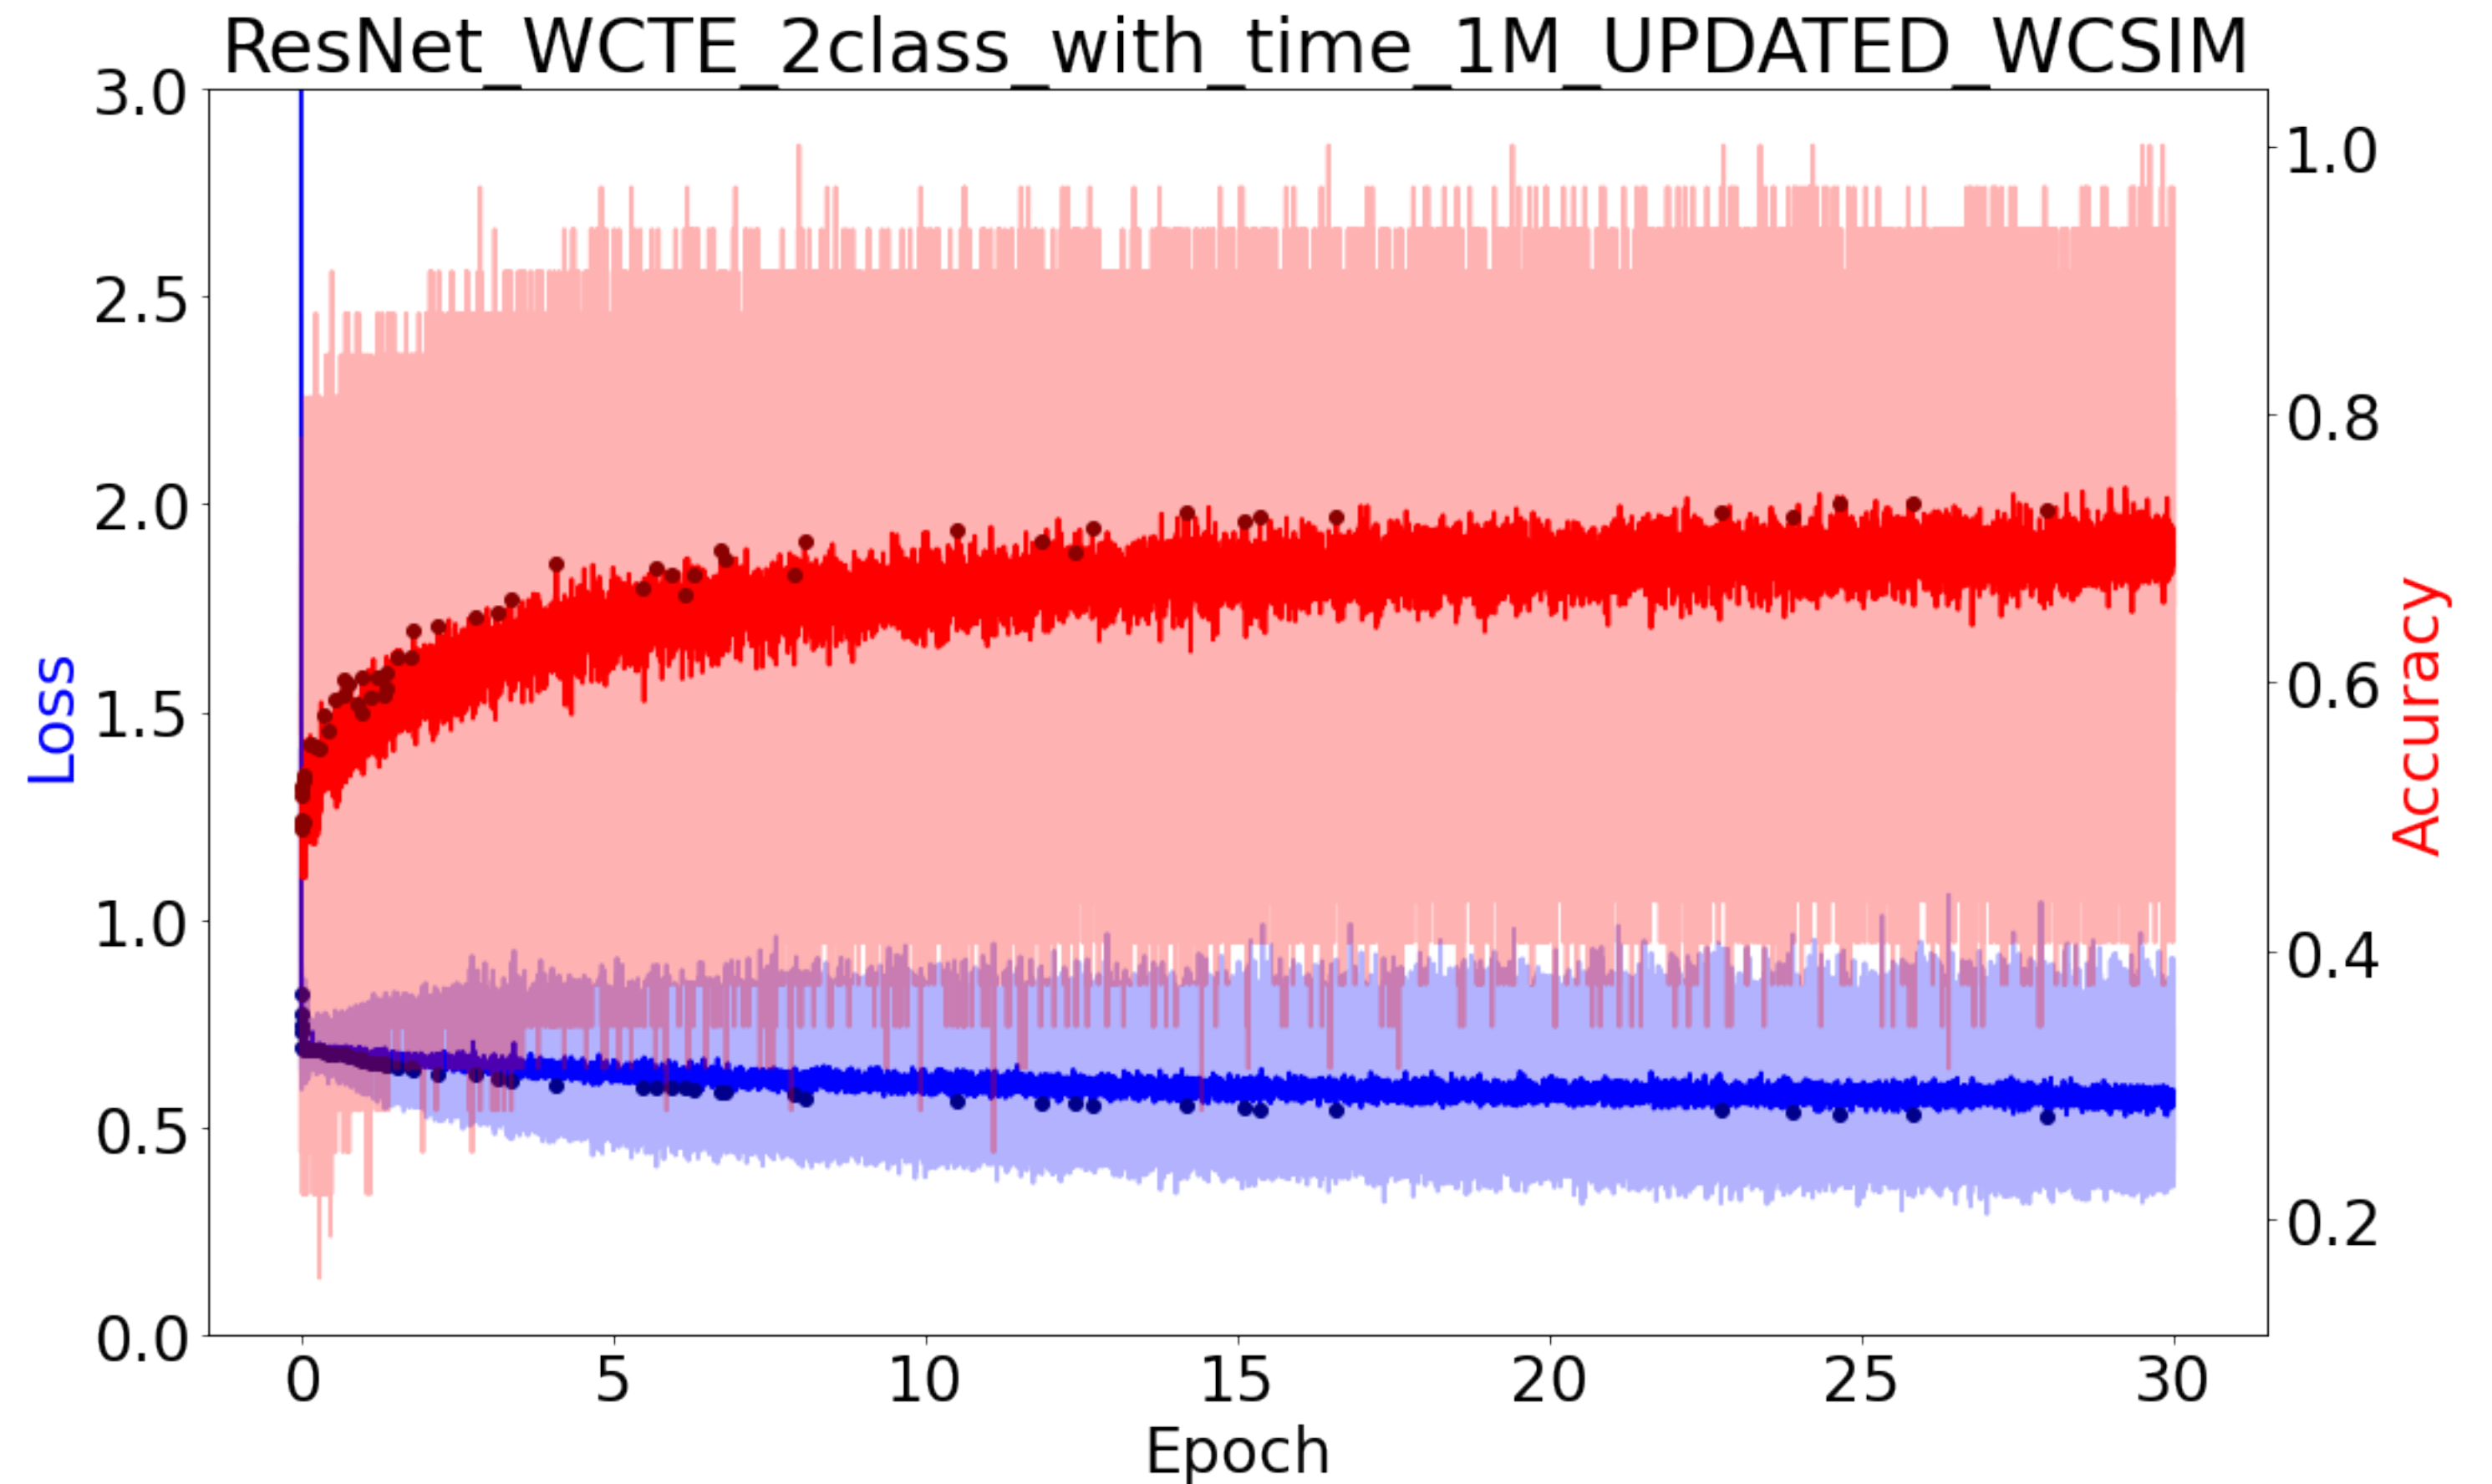

# Generation of WCSim events (1M e-/gamma):

## Distribution of energies

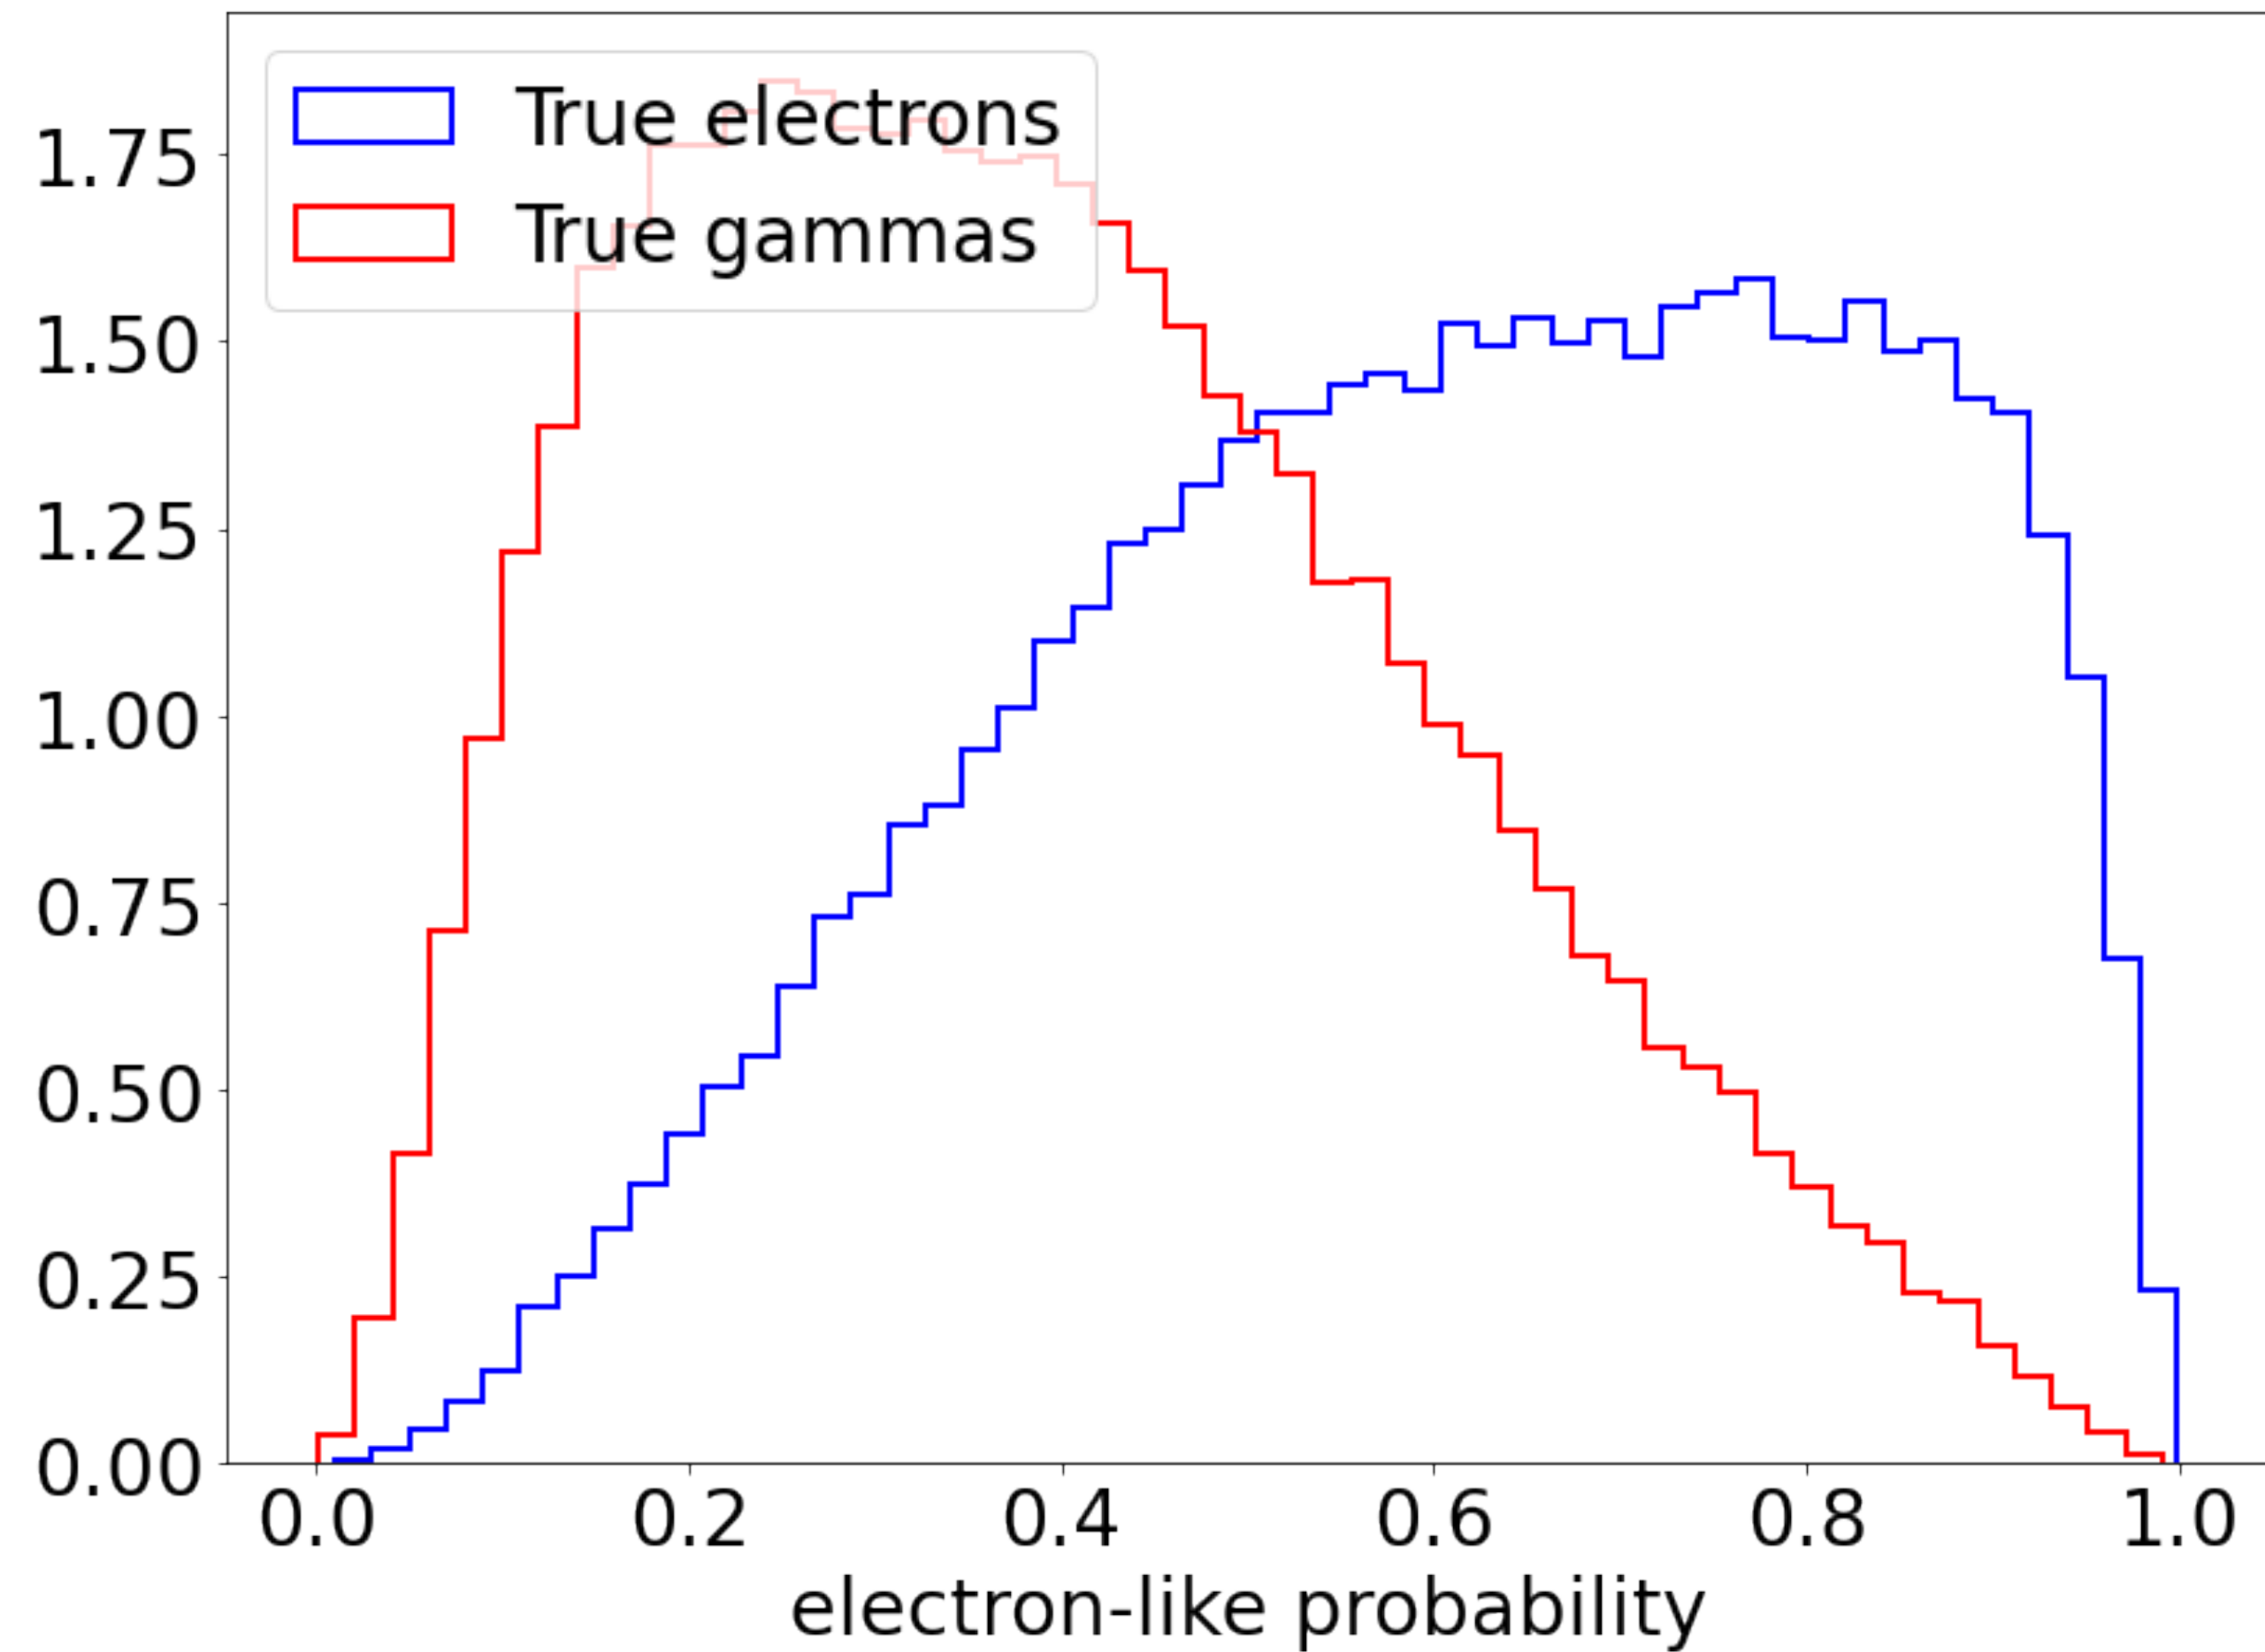

# ResNet e-/gamma training:

- 1M events
  - 70% training
  - 20% validation
  - 10% test
- Cut on # of hits  $> 30$
- Max energy 1.5 GeV
- 2 class ResNet
- Could be trained further?

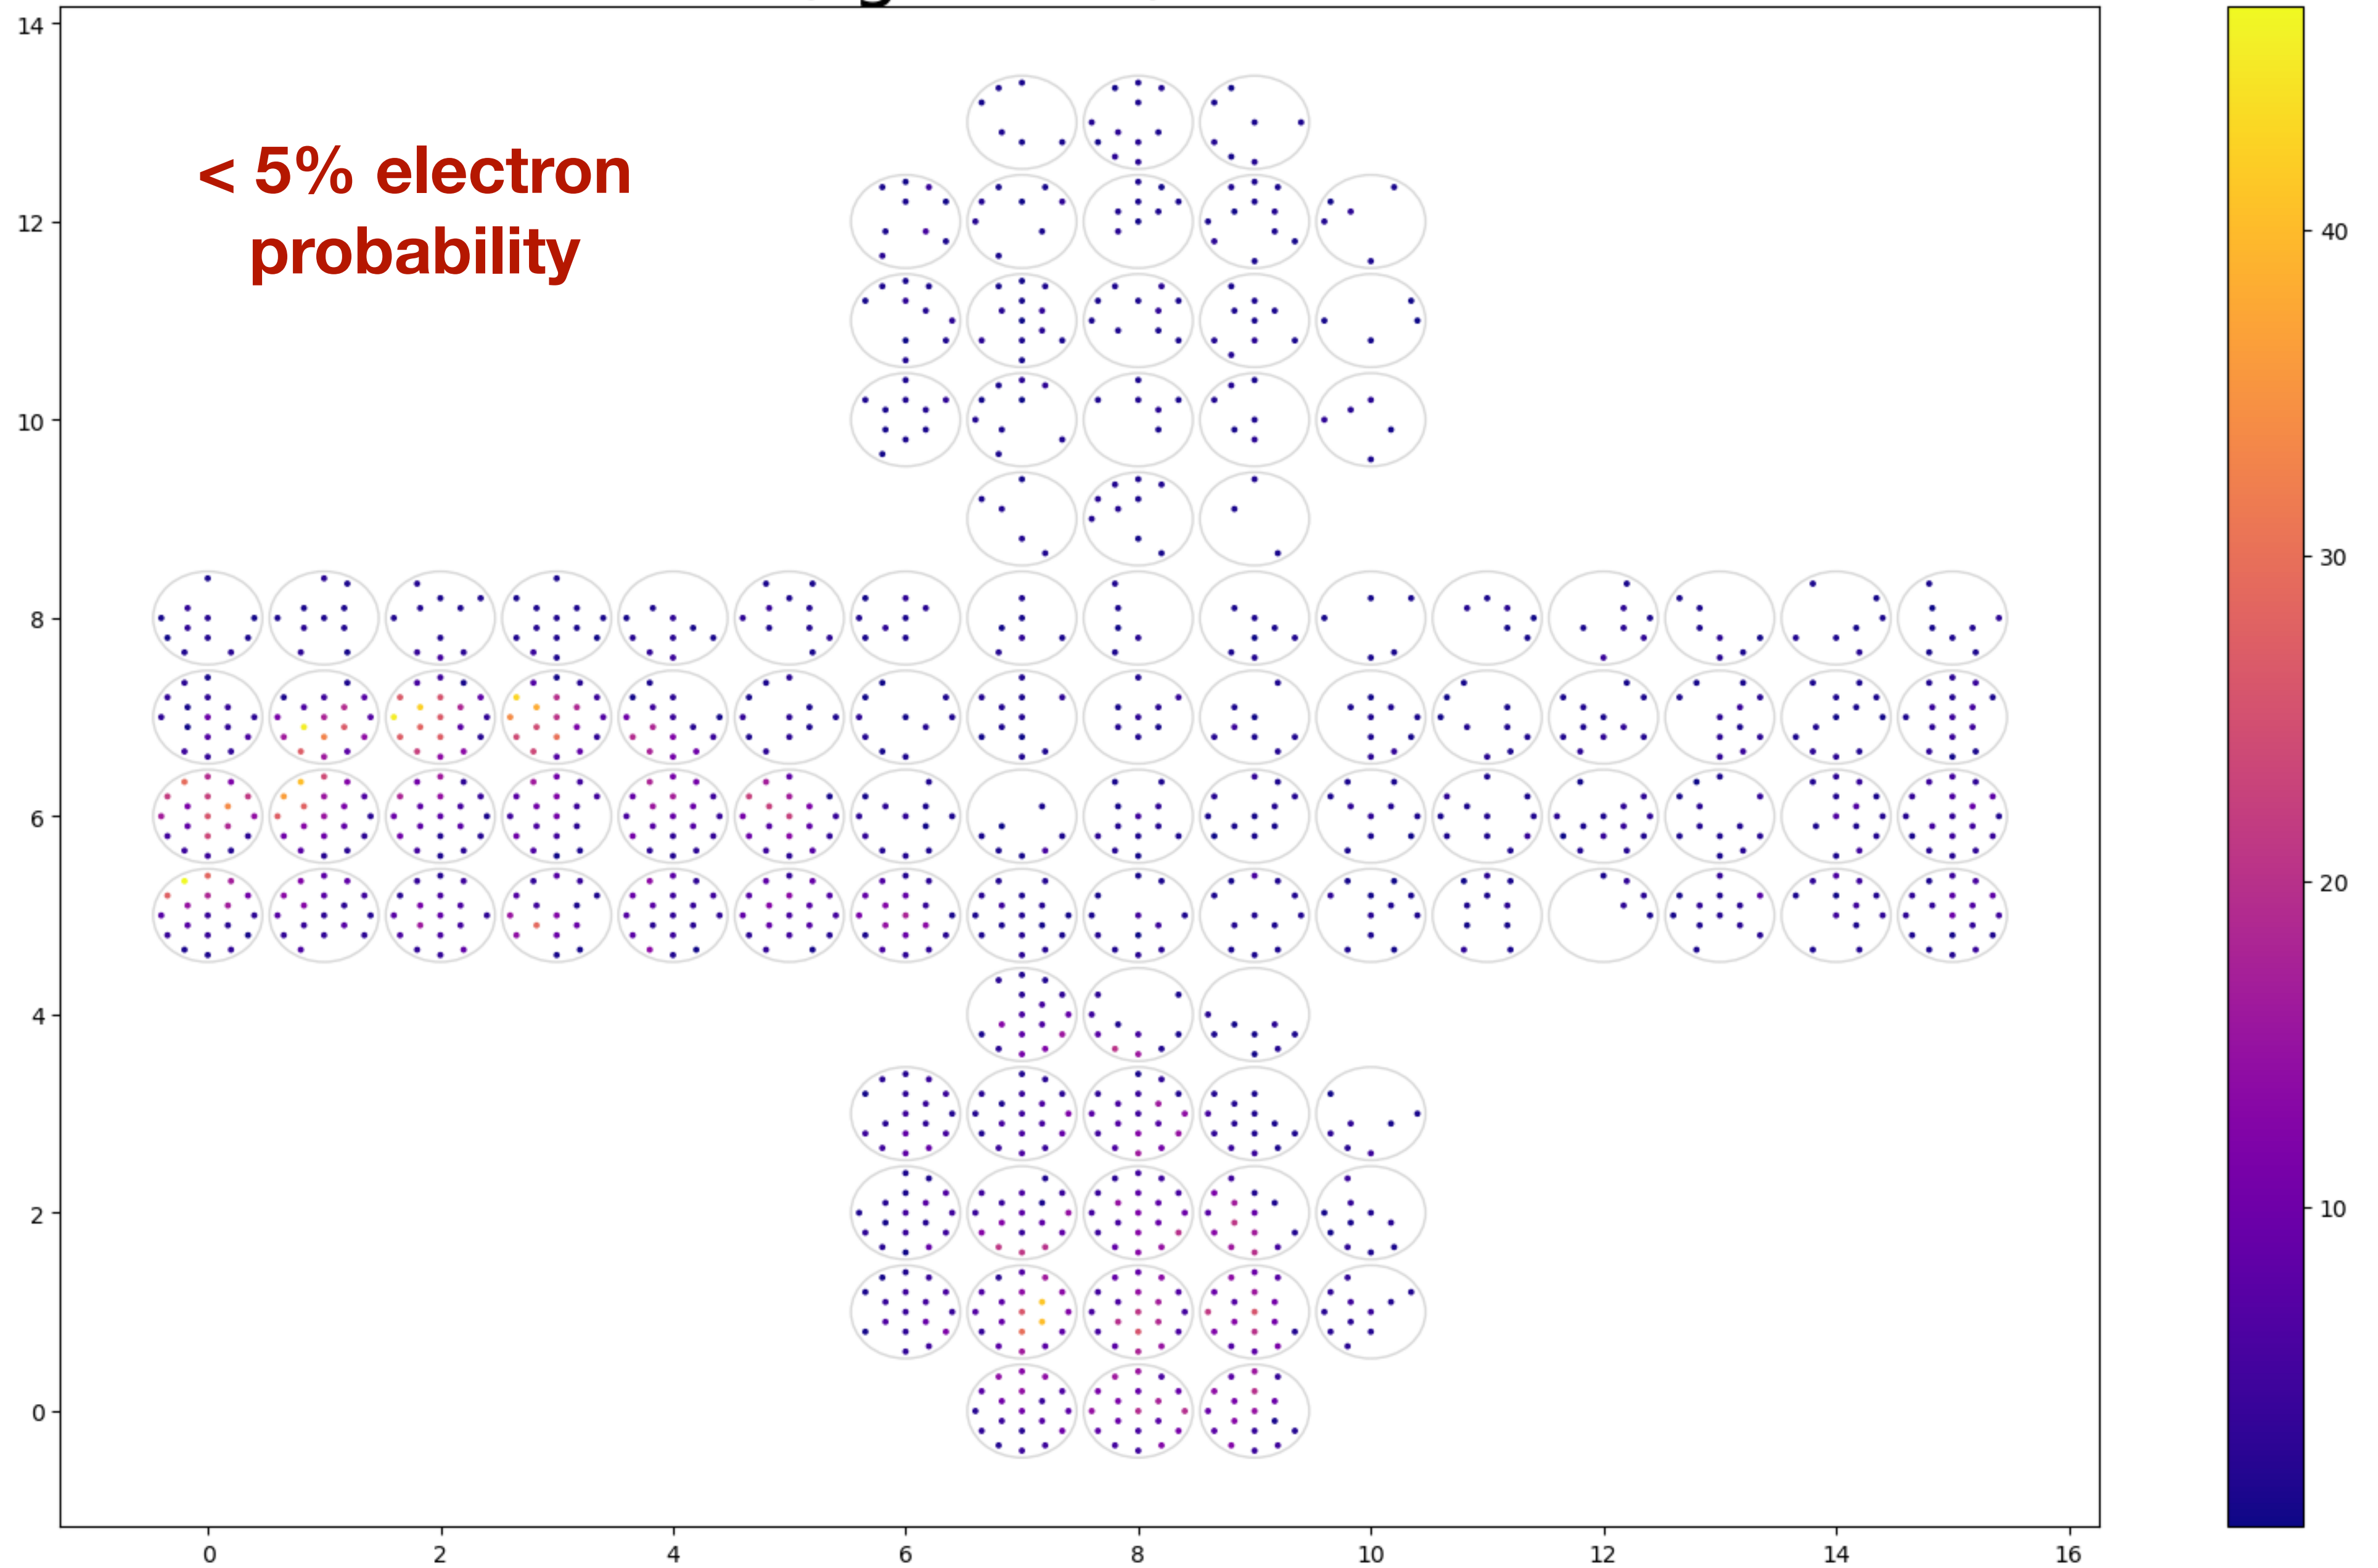

# ResNet e-/gamma discrimination:

- Neural network classification electron probability

# Event #189, gamma, E = 686.81 MeV

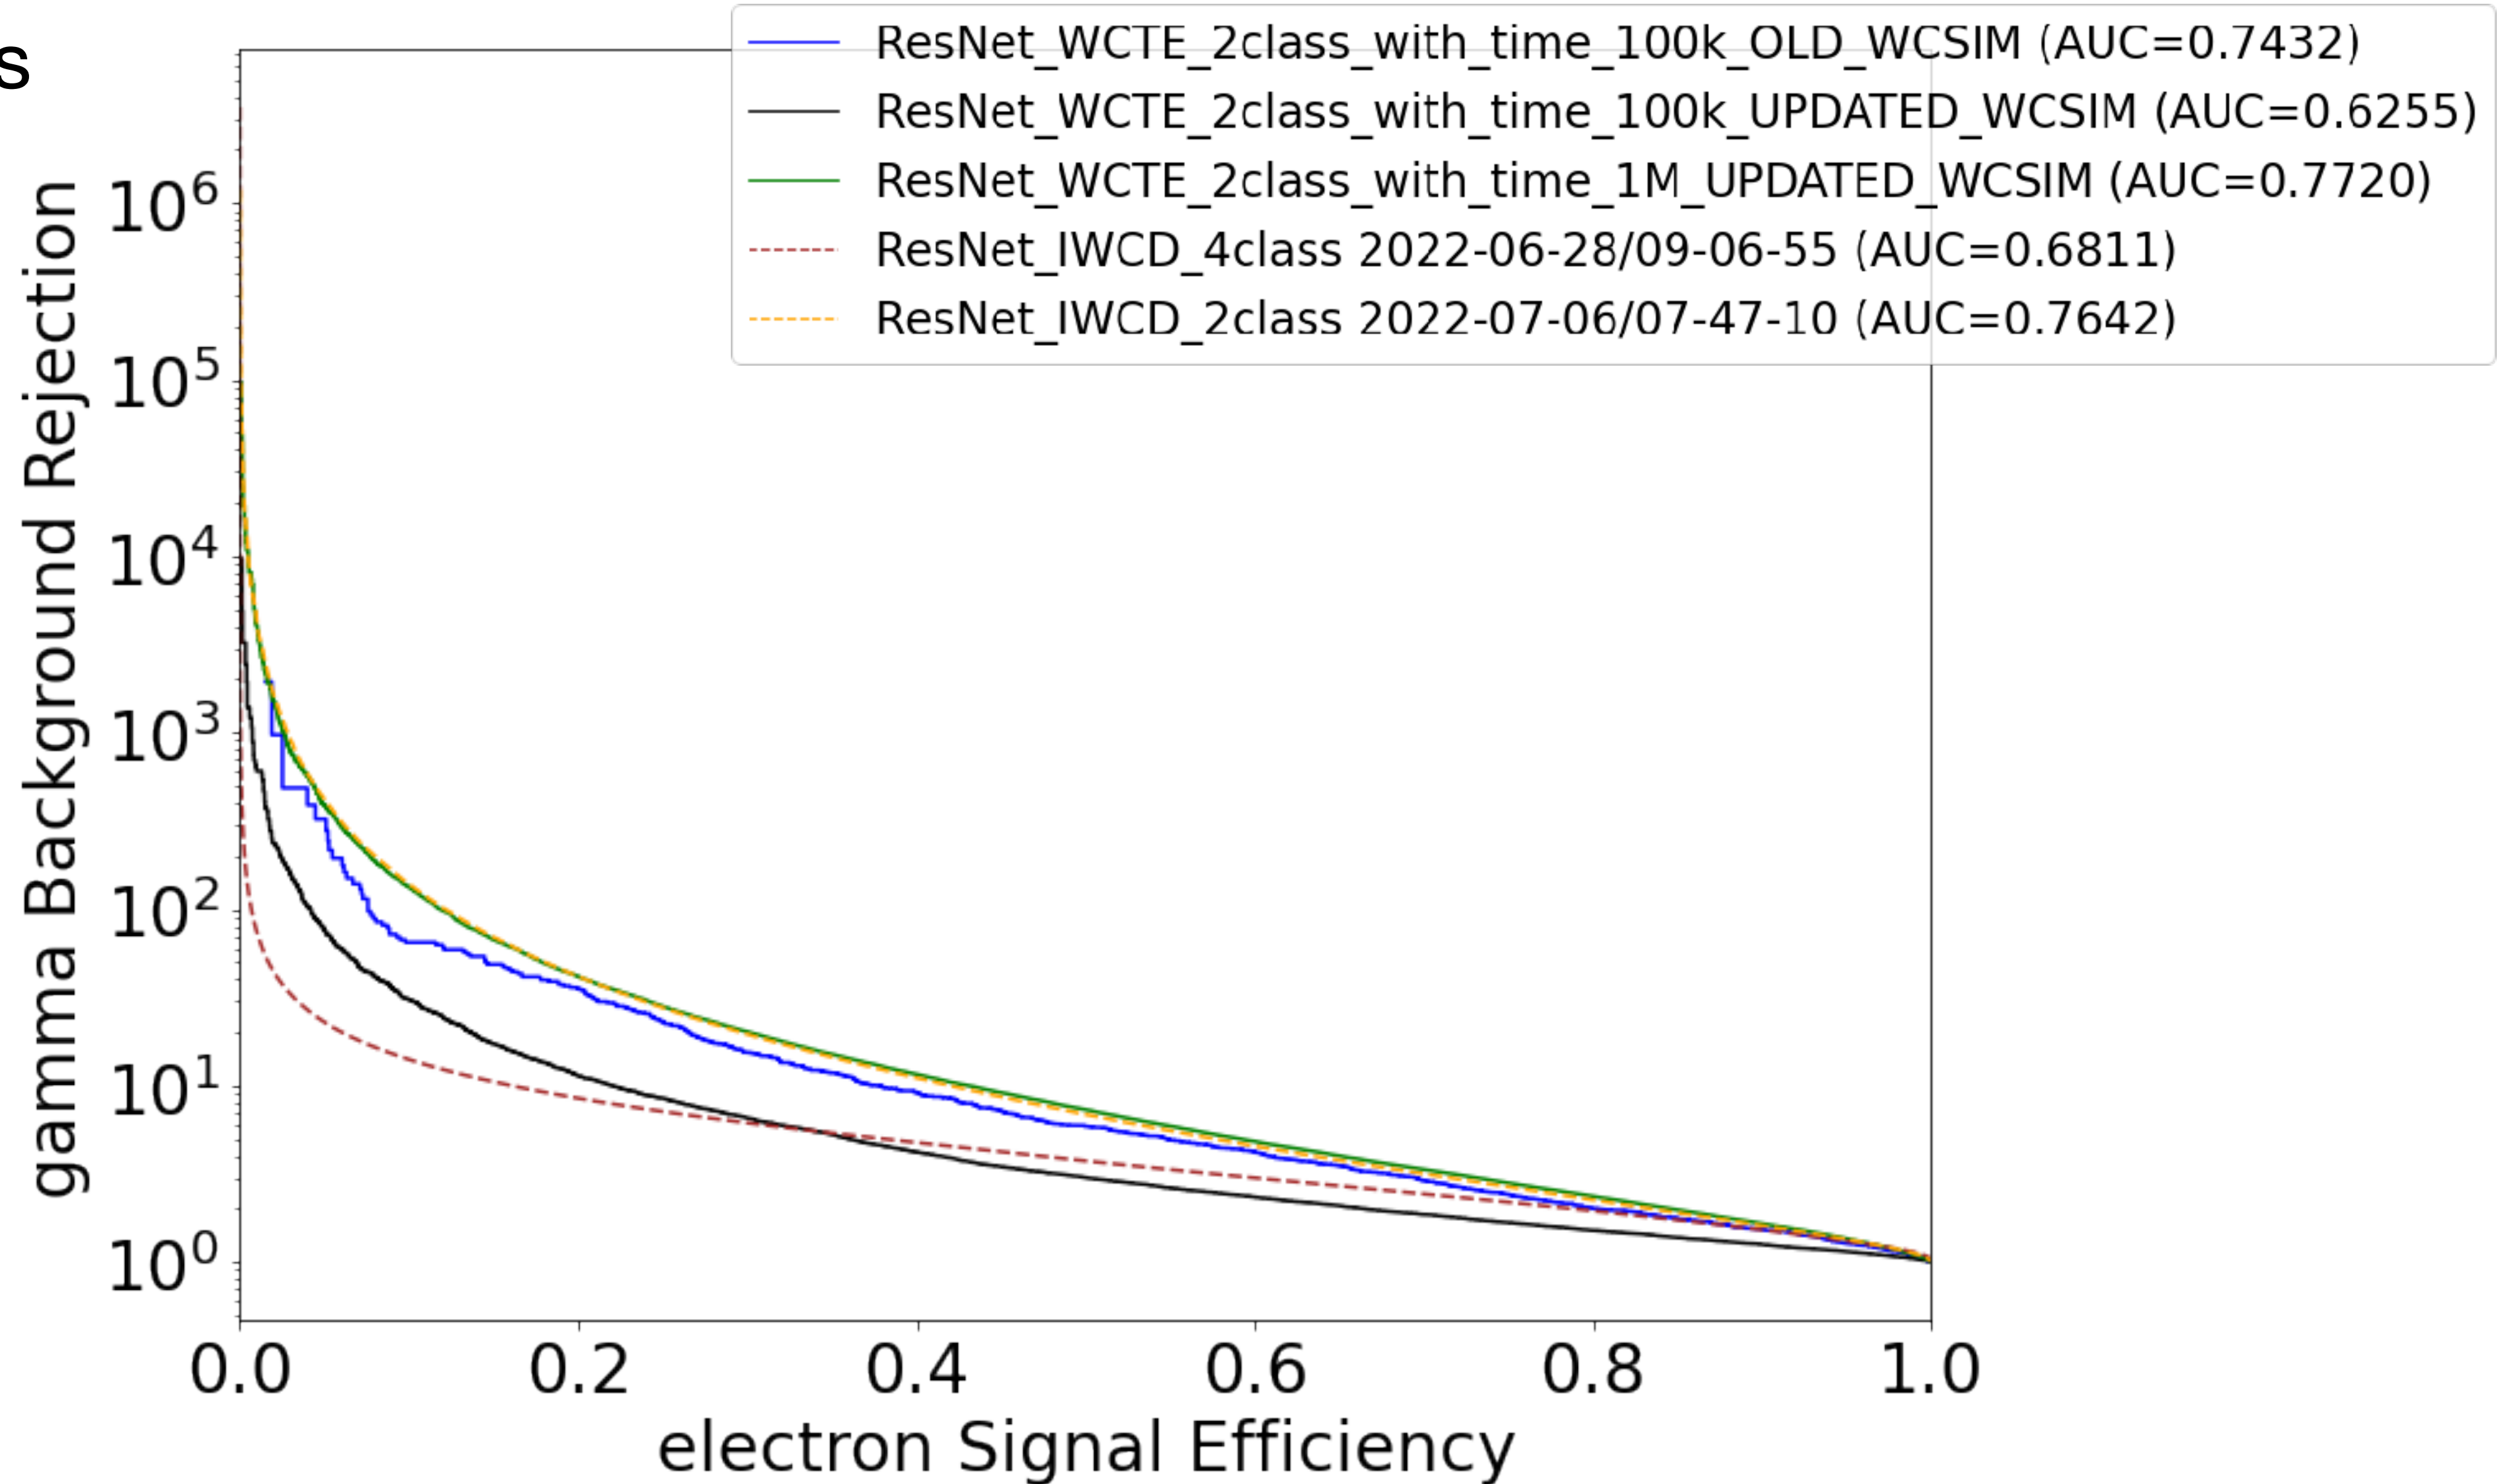

# Event #1000070, electron, E = 765.64 MeV

# ResNet e-/gamma discrimination:

- ROC curves

# Summary:

- e-/gamma separation shown in simulation in WCTE with WatChMaL/ResNet
- What should be next focus?
  - How to apply these ML tools to WCTE data
  - Reconstruction of vertices/energy of low energy (neutron capture) events?

# Event #400, gamma, E = 271.75 MeV

# Event #656, gamma, E = 656.43 MeV

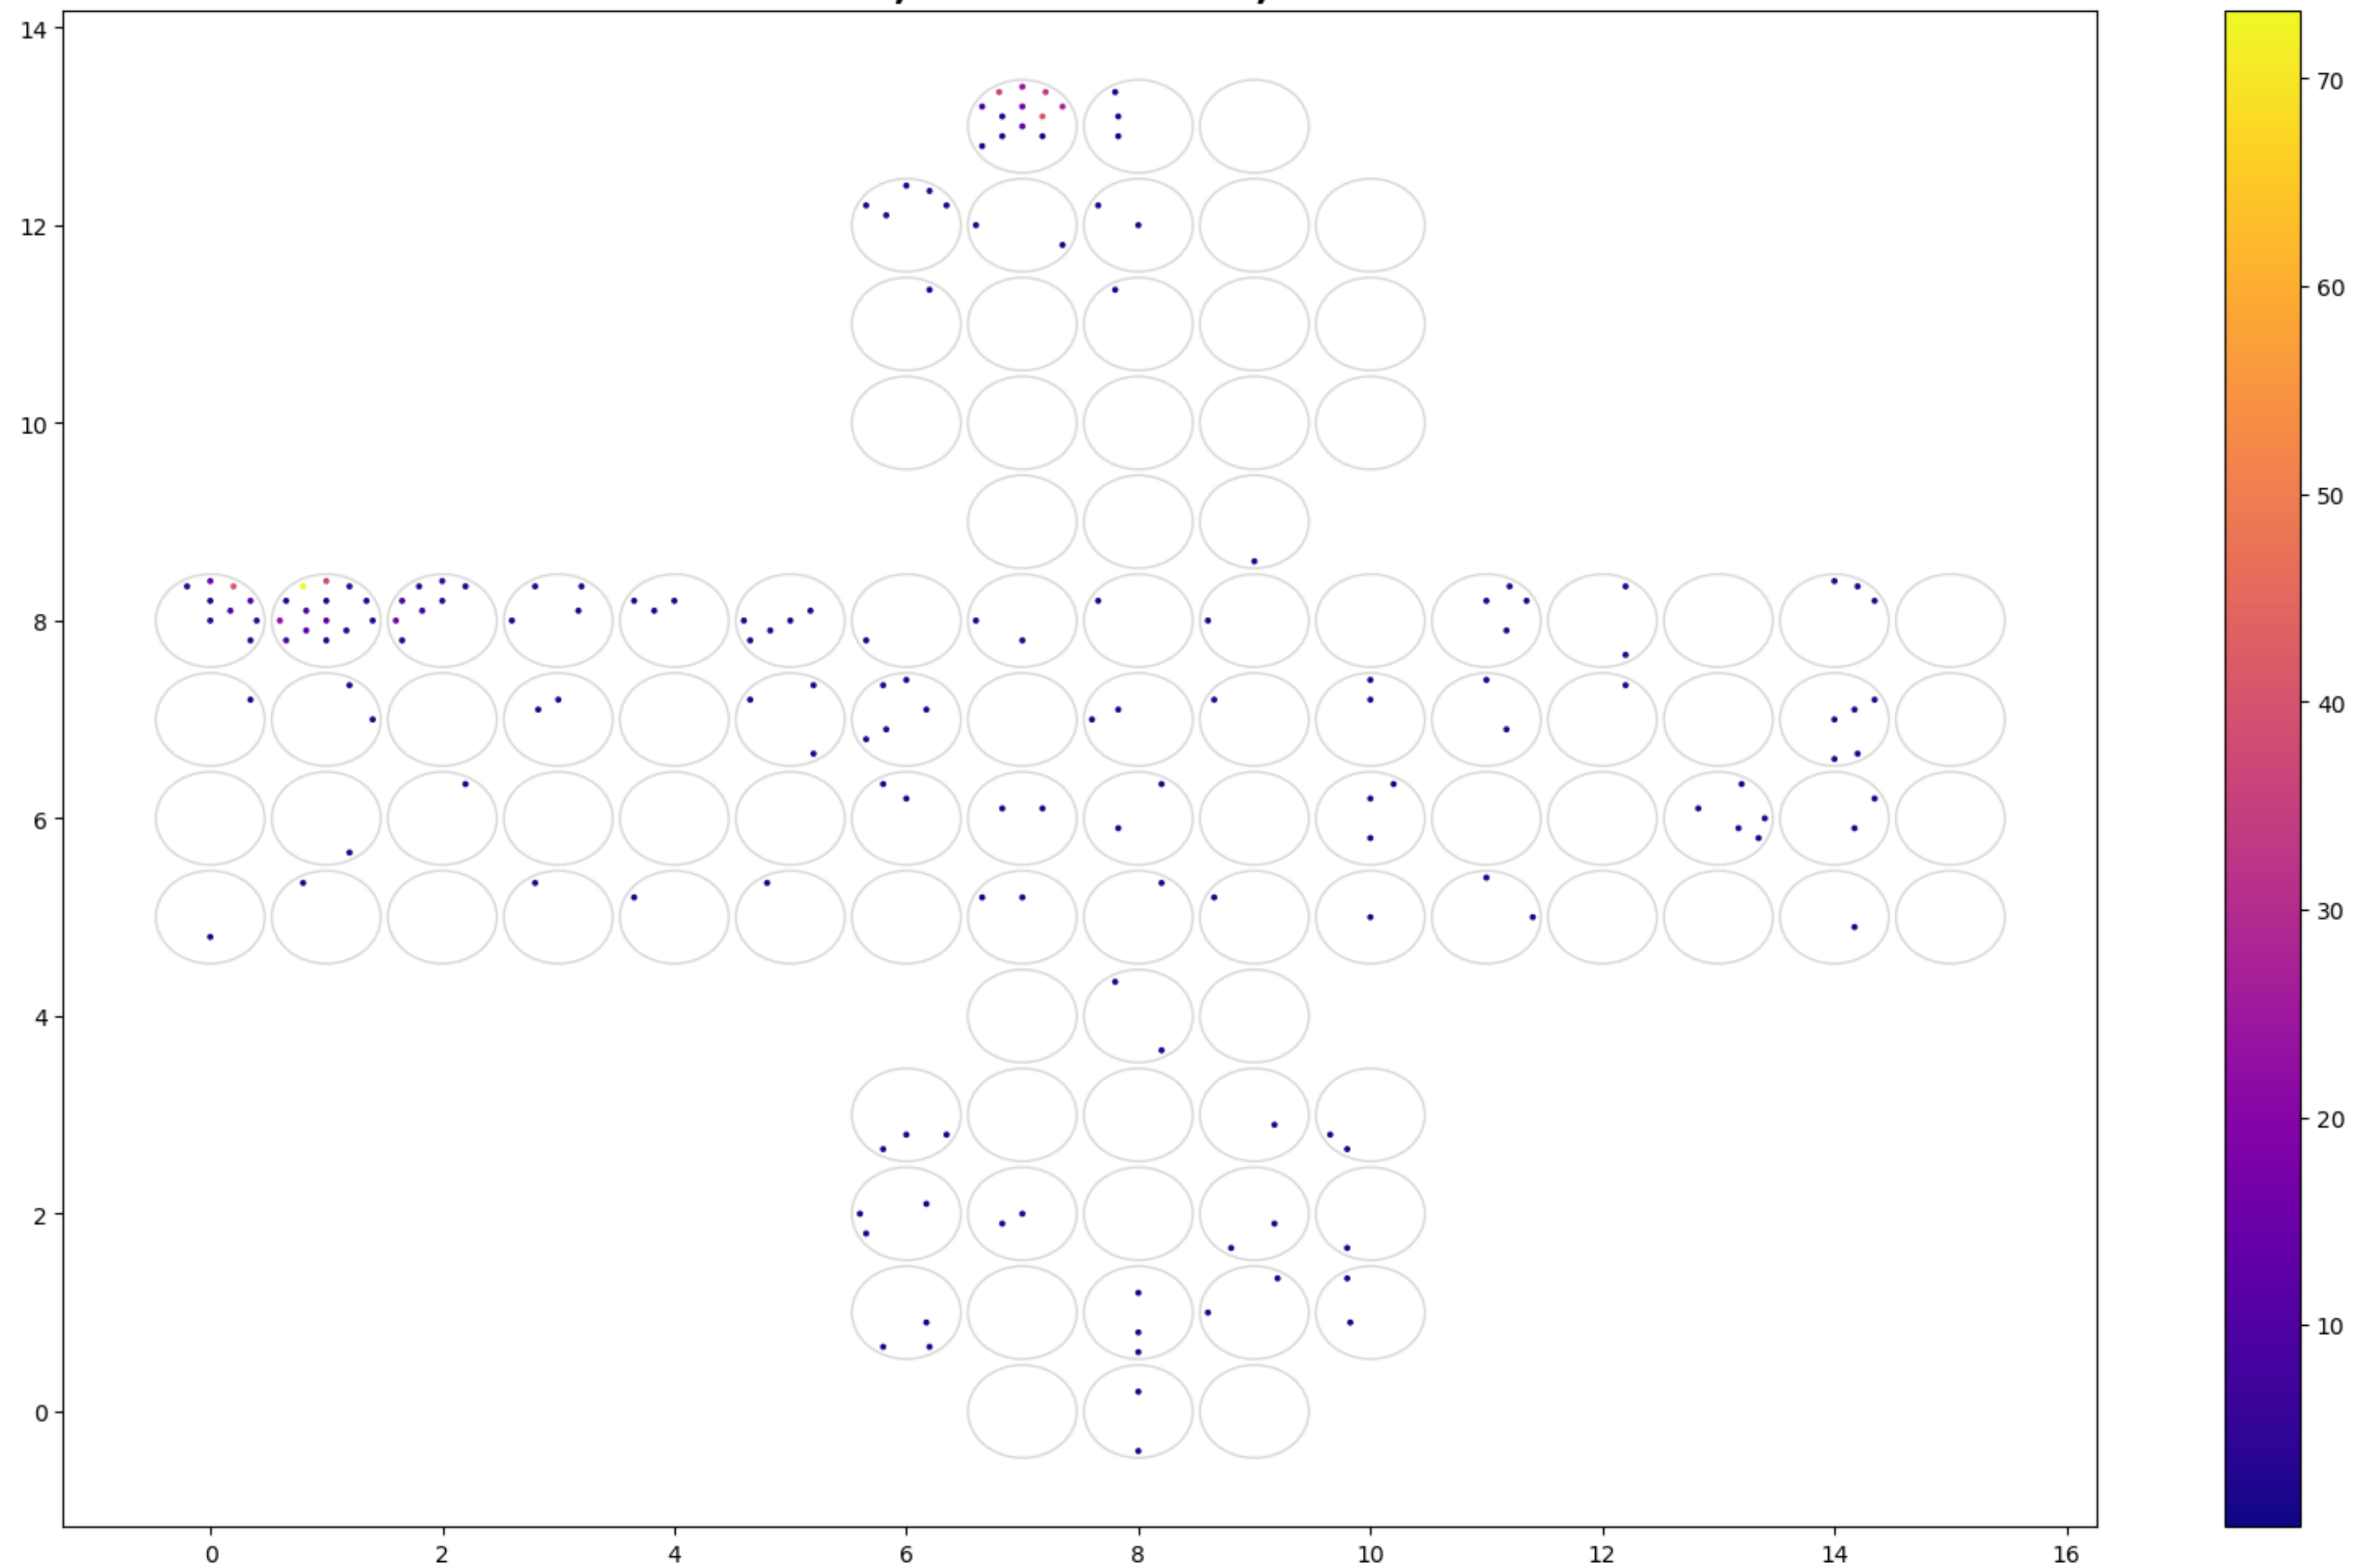

# Event #887, gamma, E = 728.88 MeV

# Event #987, gamma, E = 1217.74 MeV

# Event #1000073, electron, E = 415.31 MeV

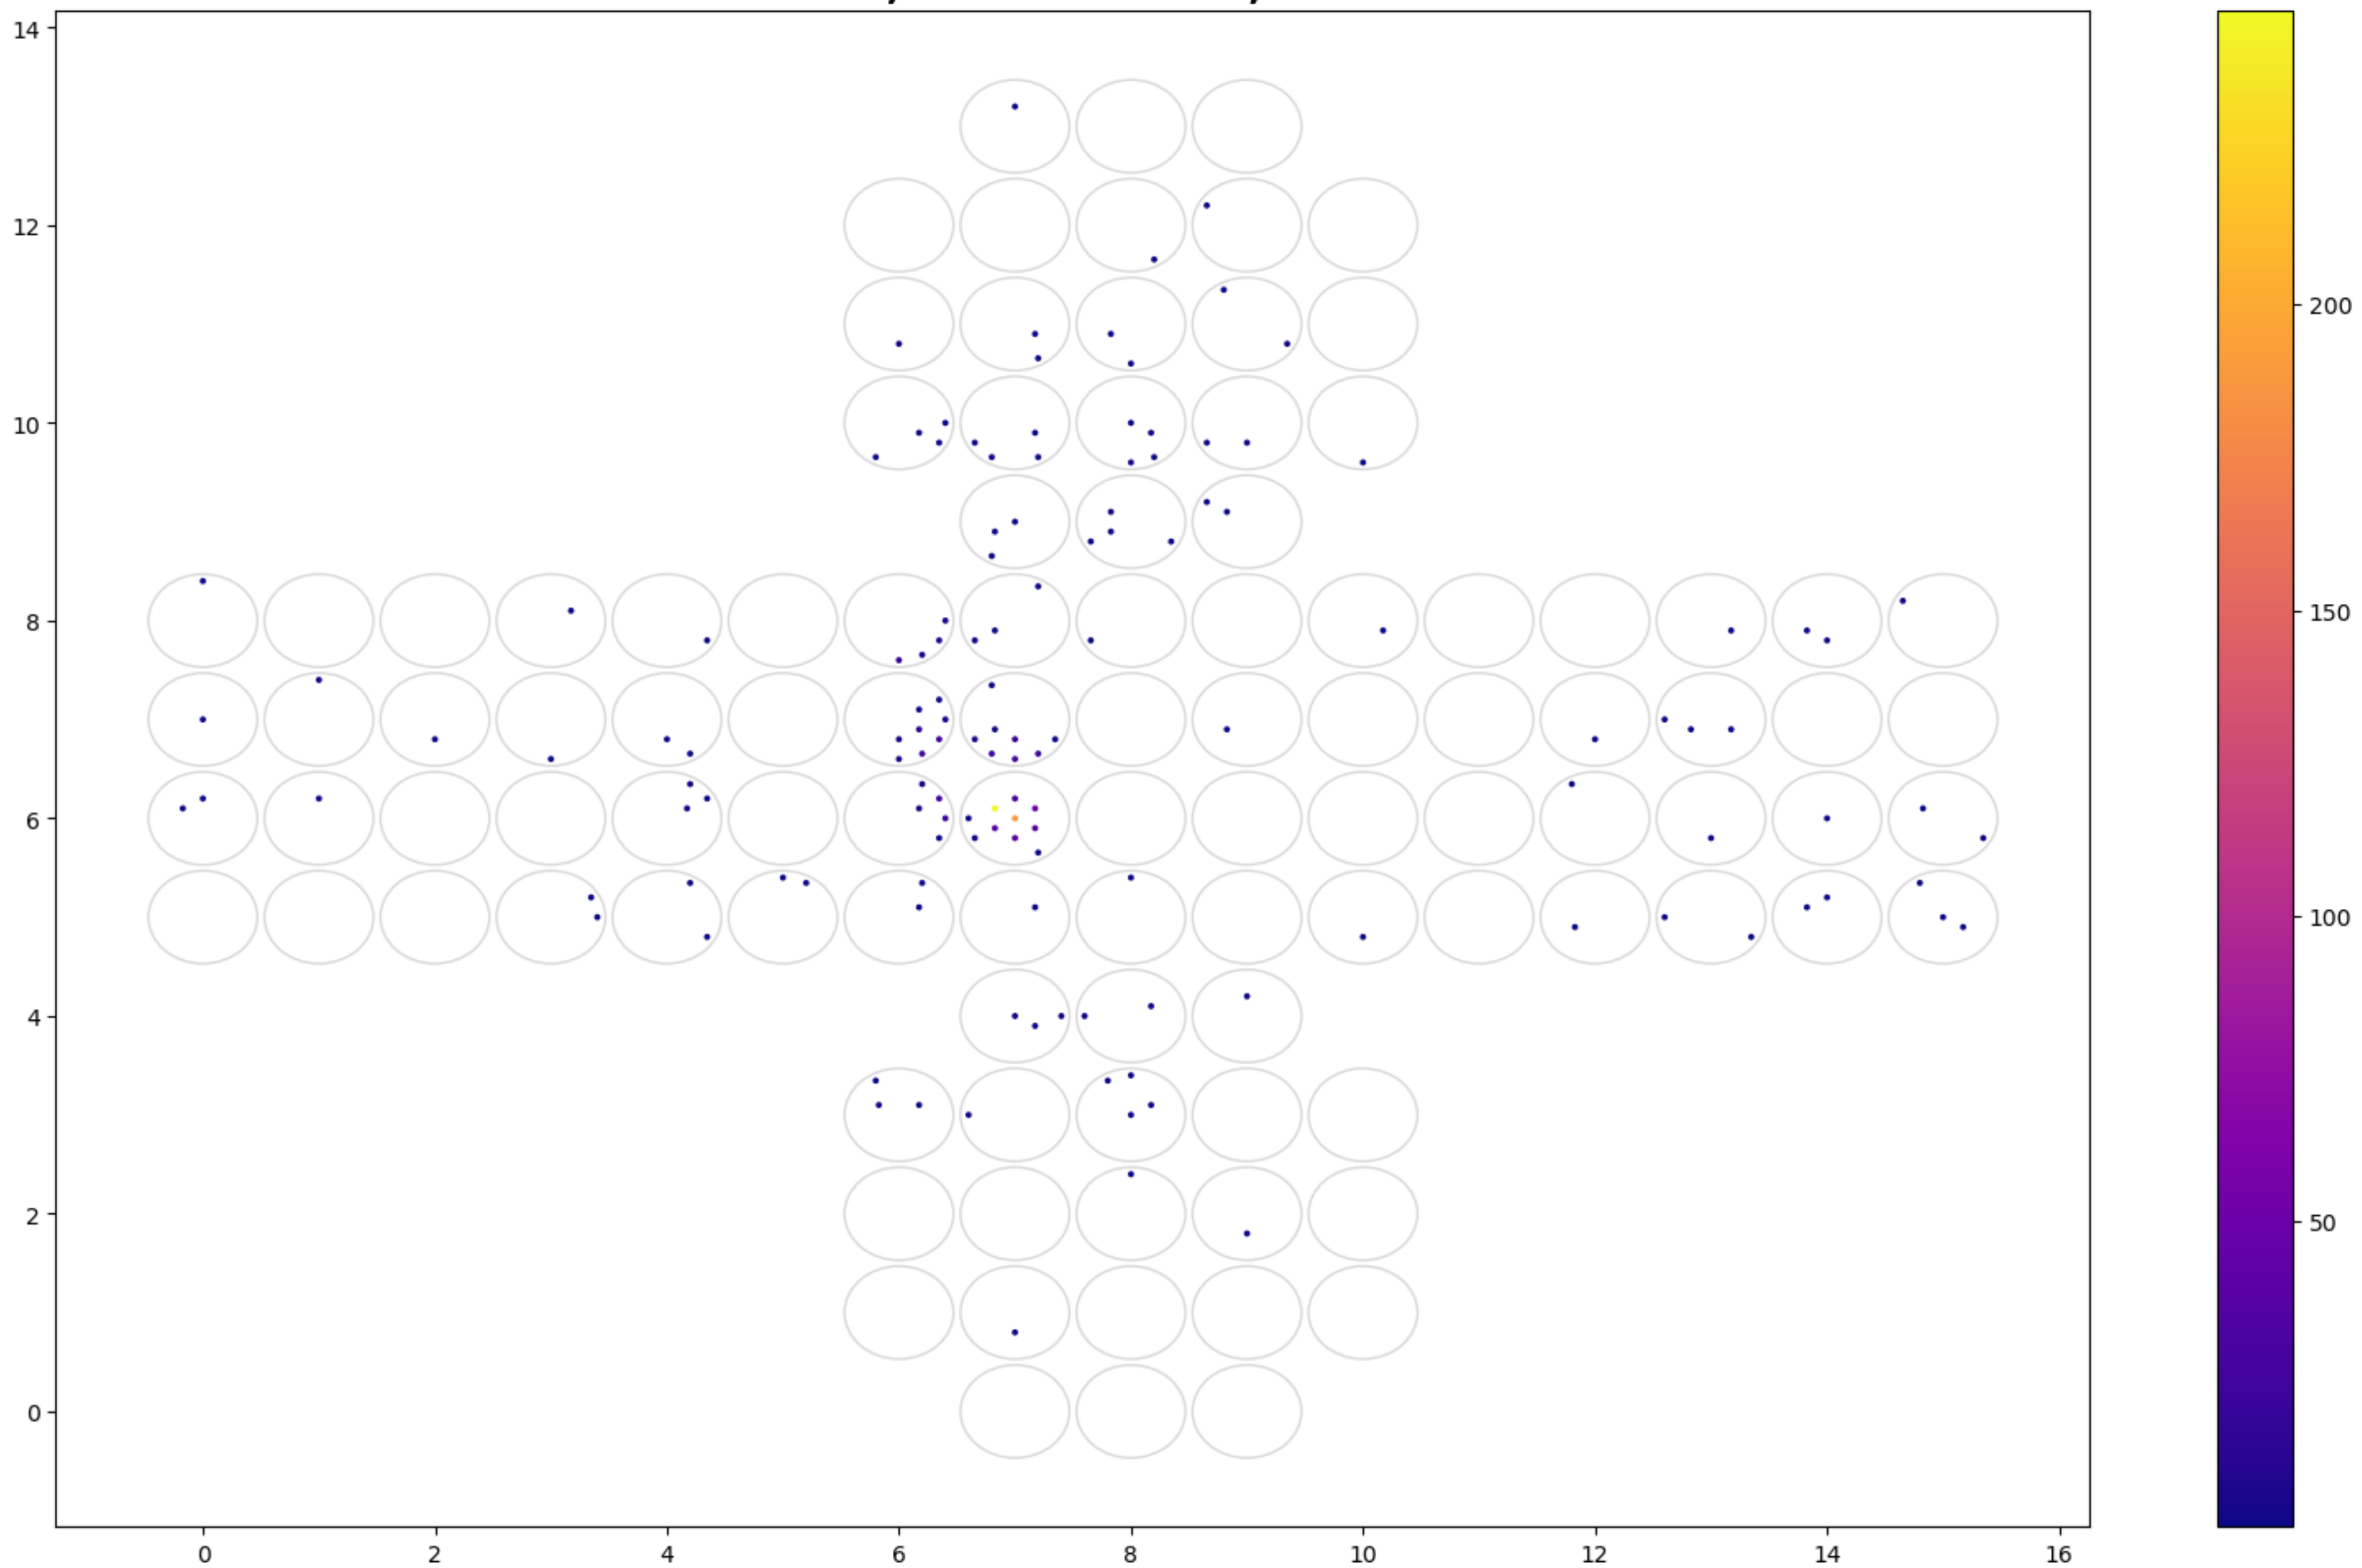

# Event #1000136, electron, E = 1073.07 MeV

# Event #1000208, electron, E = 849.25 MeV

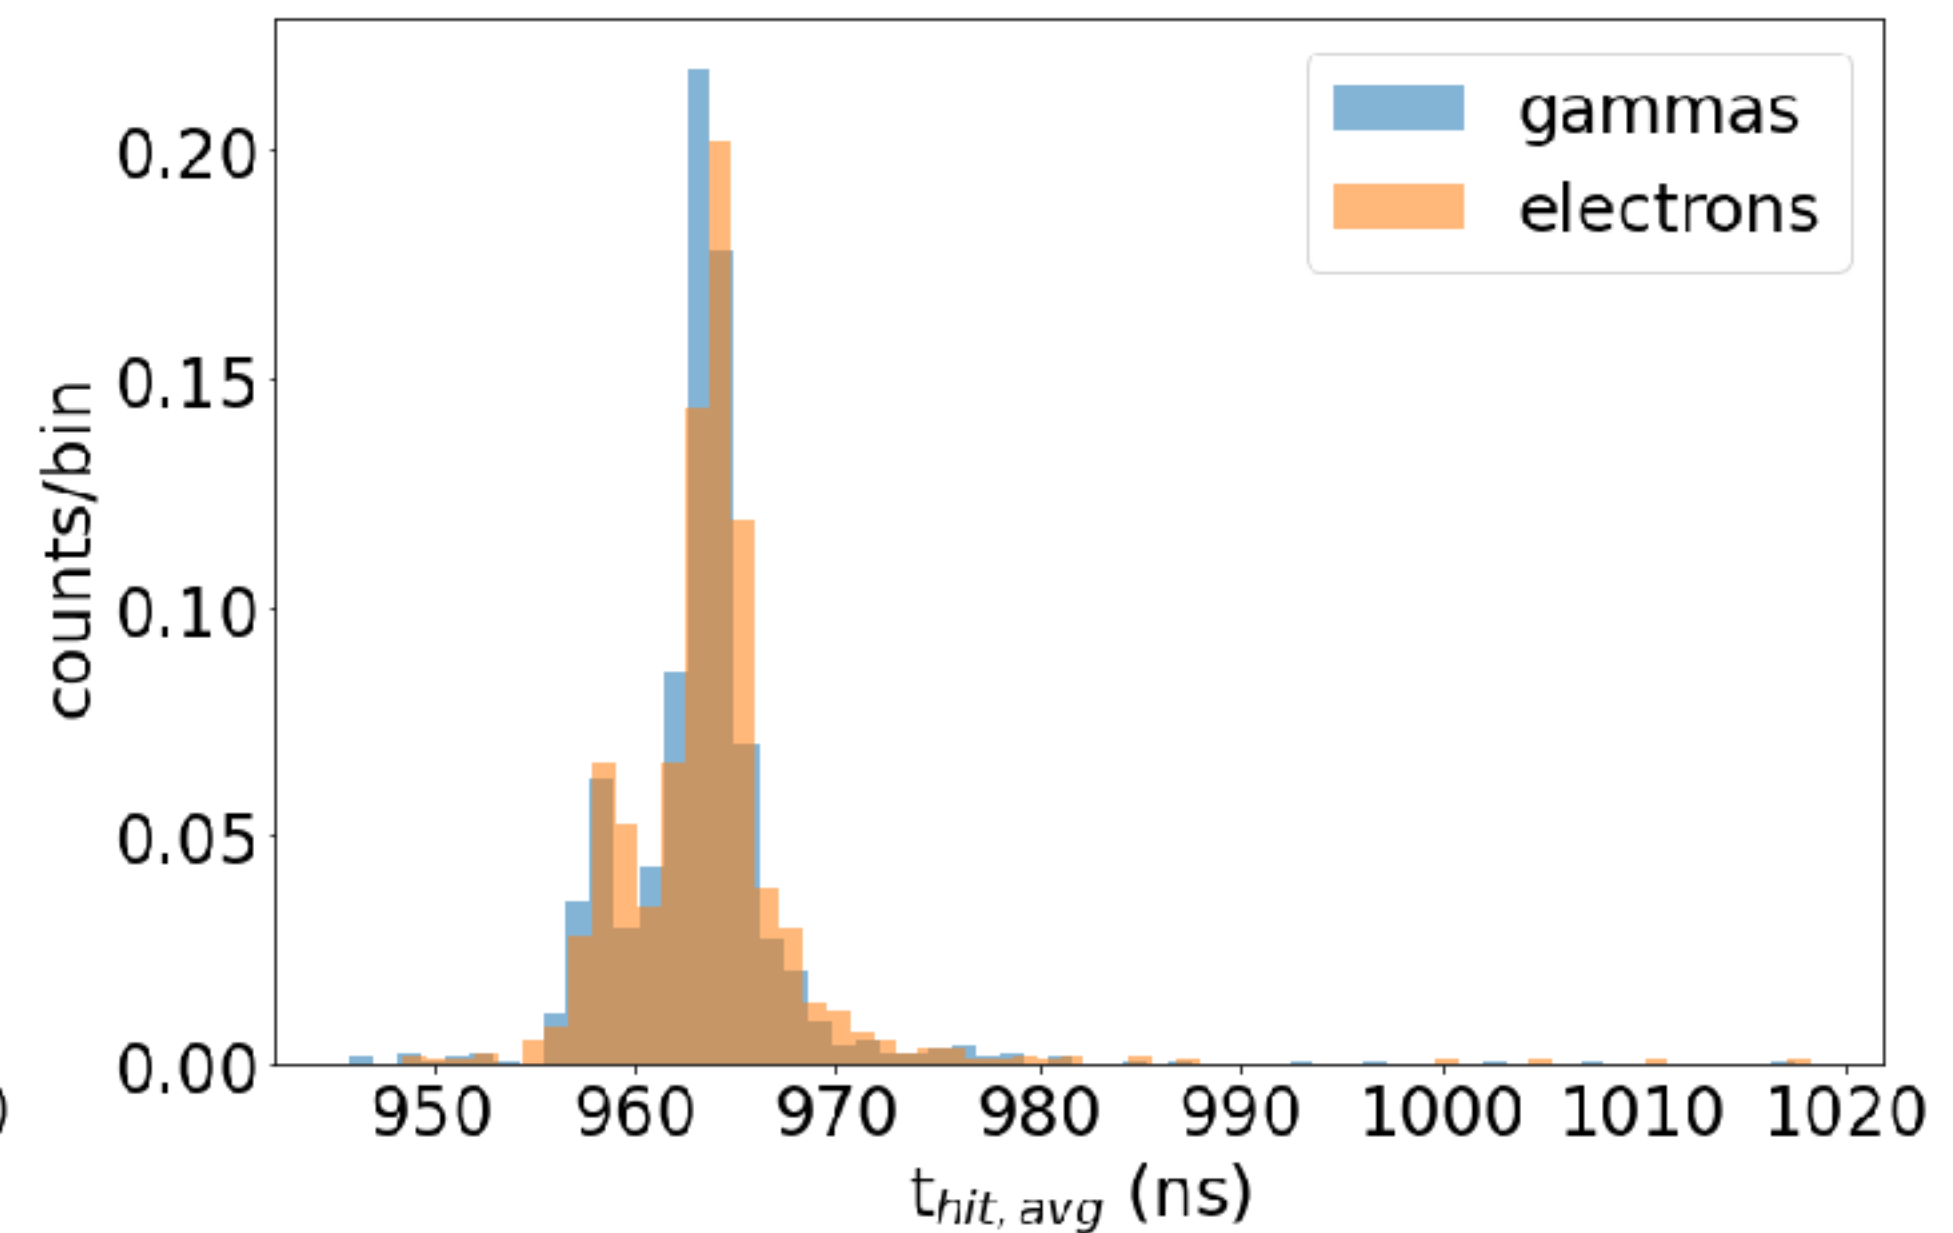

### Individual hit charges and hit times (for 1915 events)

### Generation of WCSim events (1M e-/gamma):

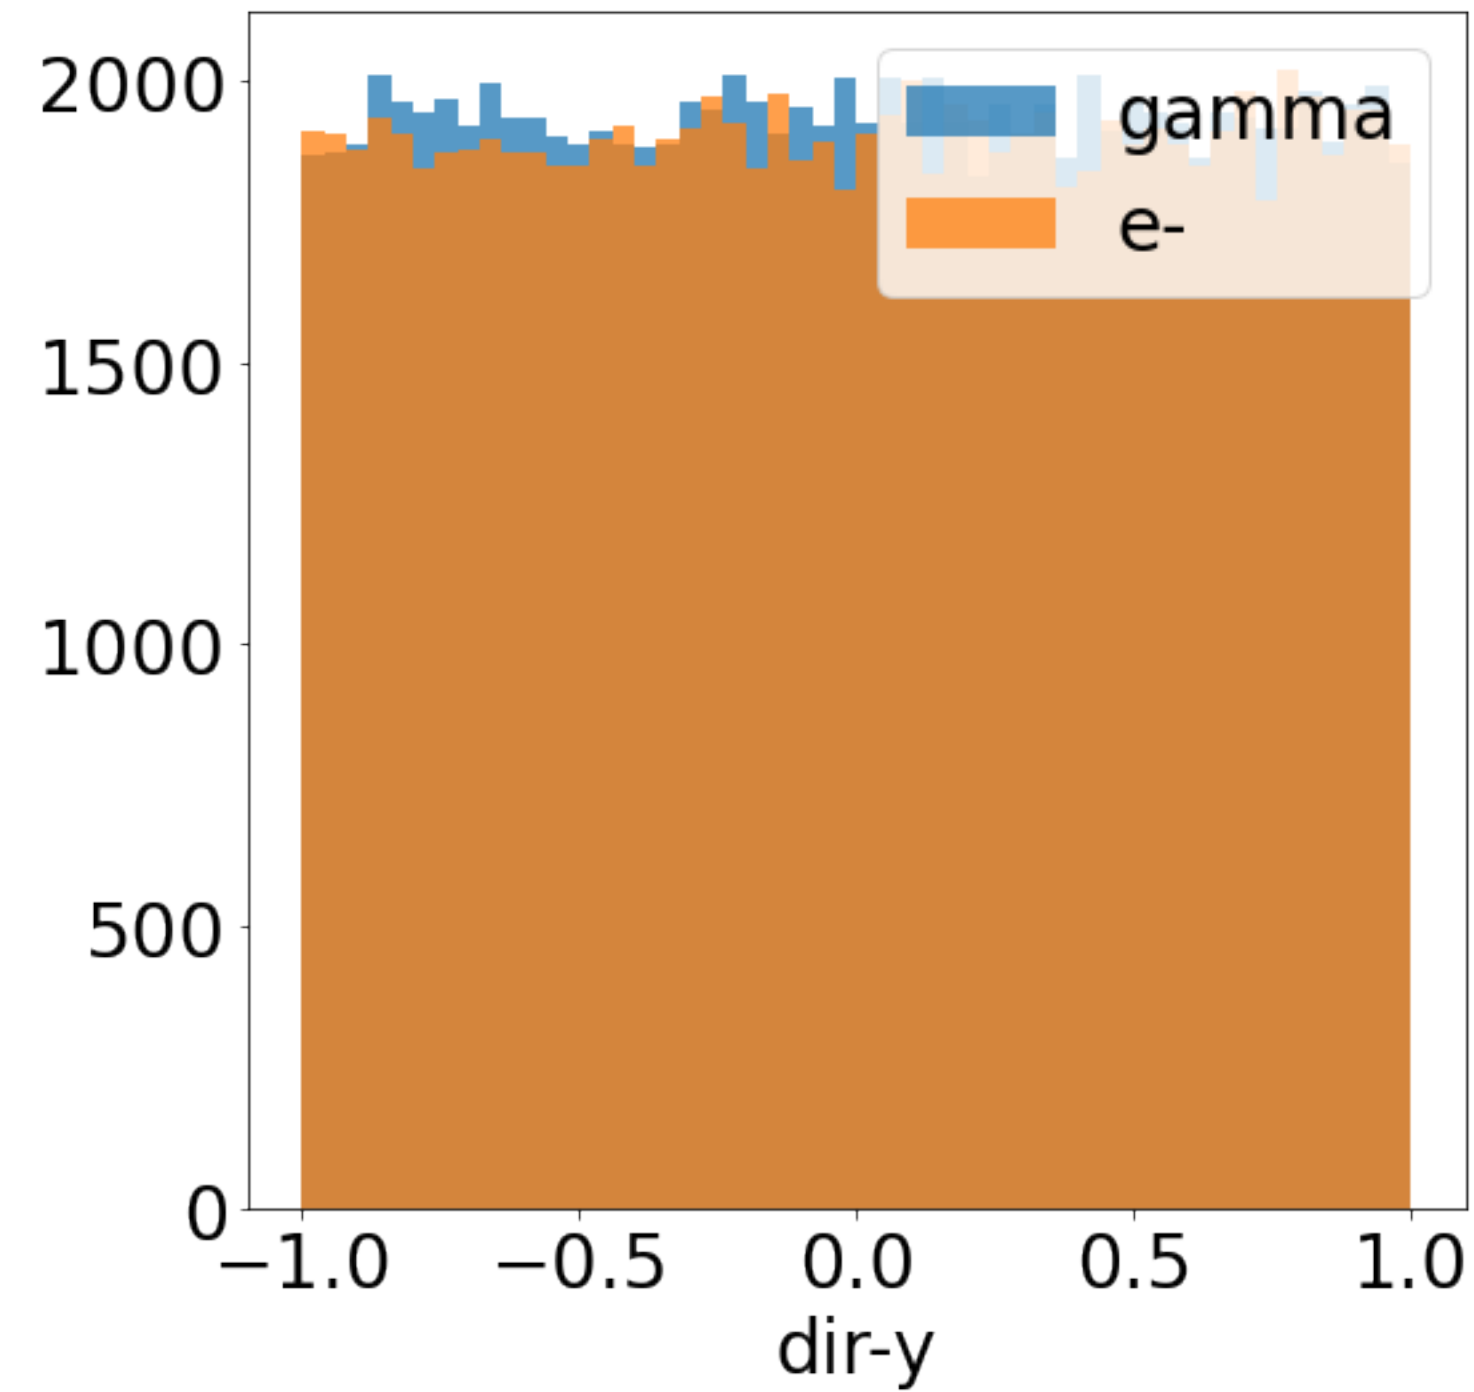

### Hit charge sum, average times (for 1915 events)

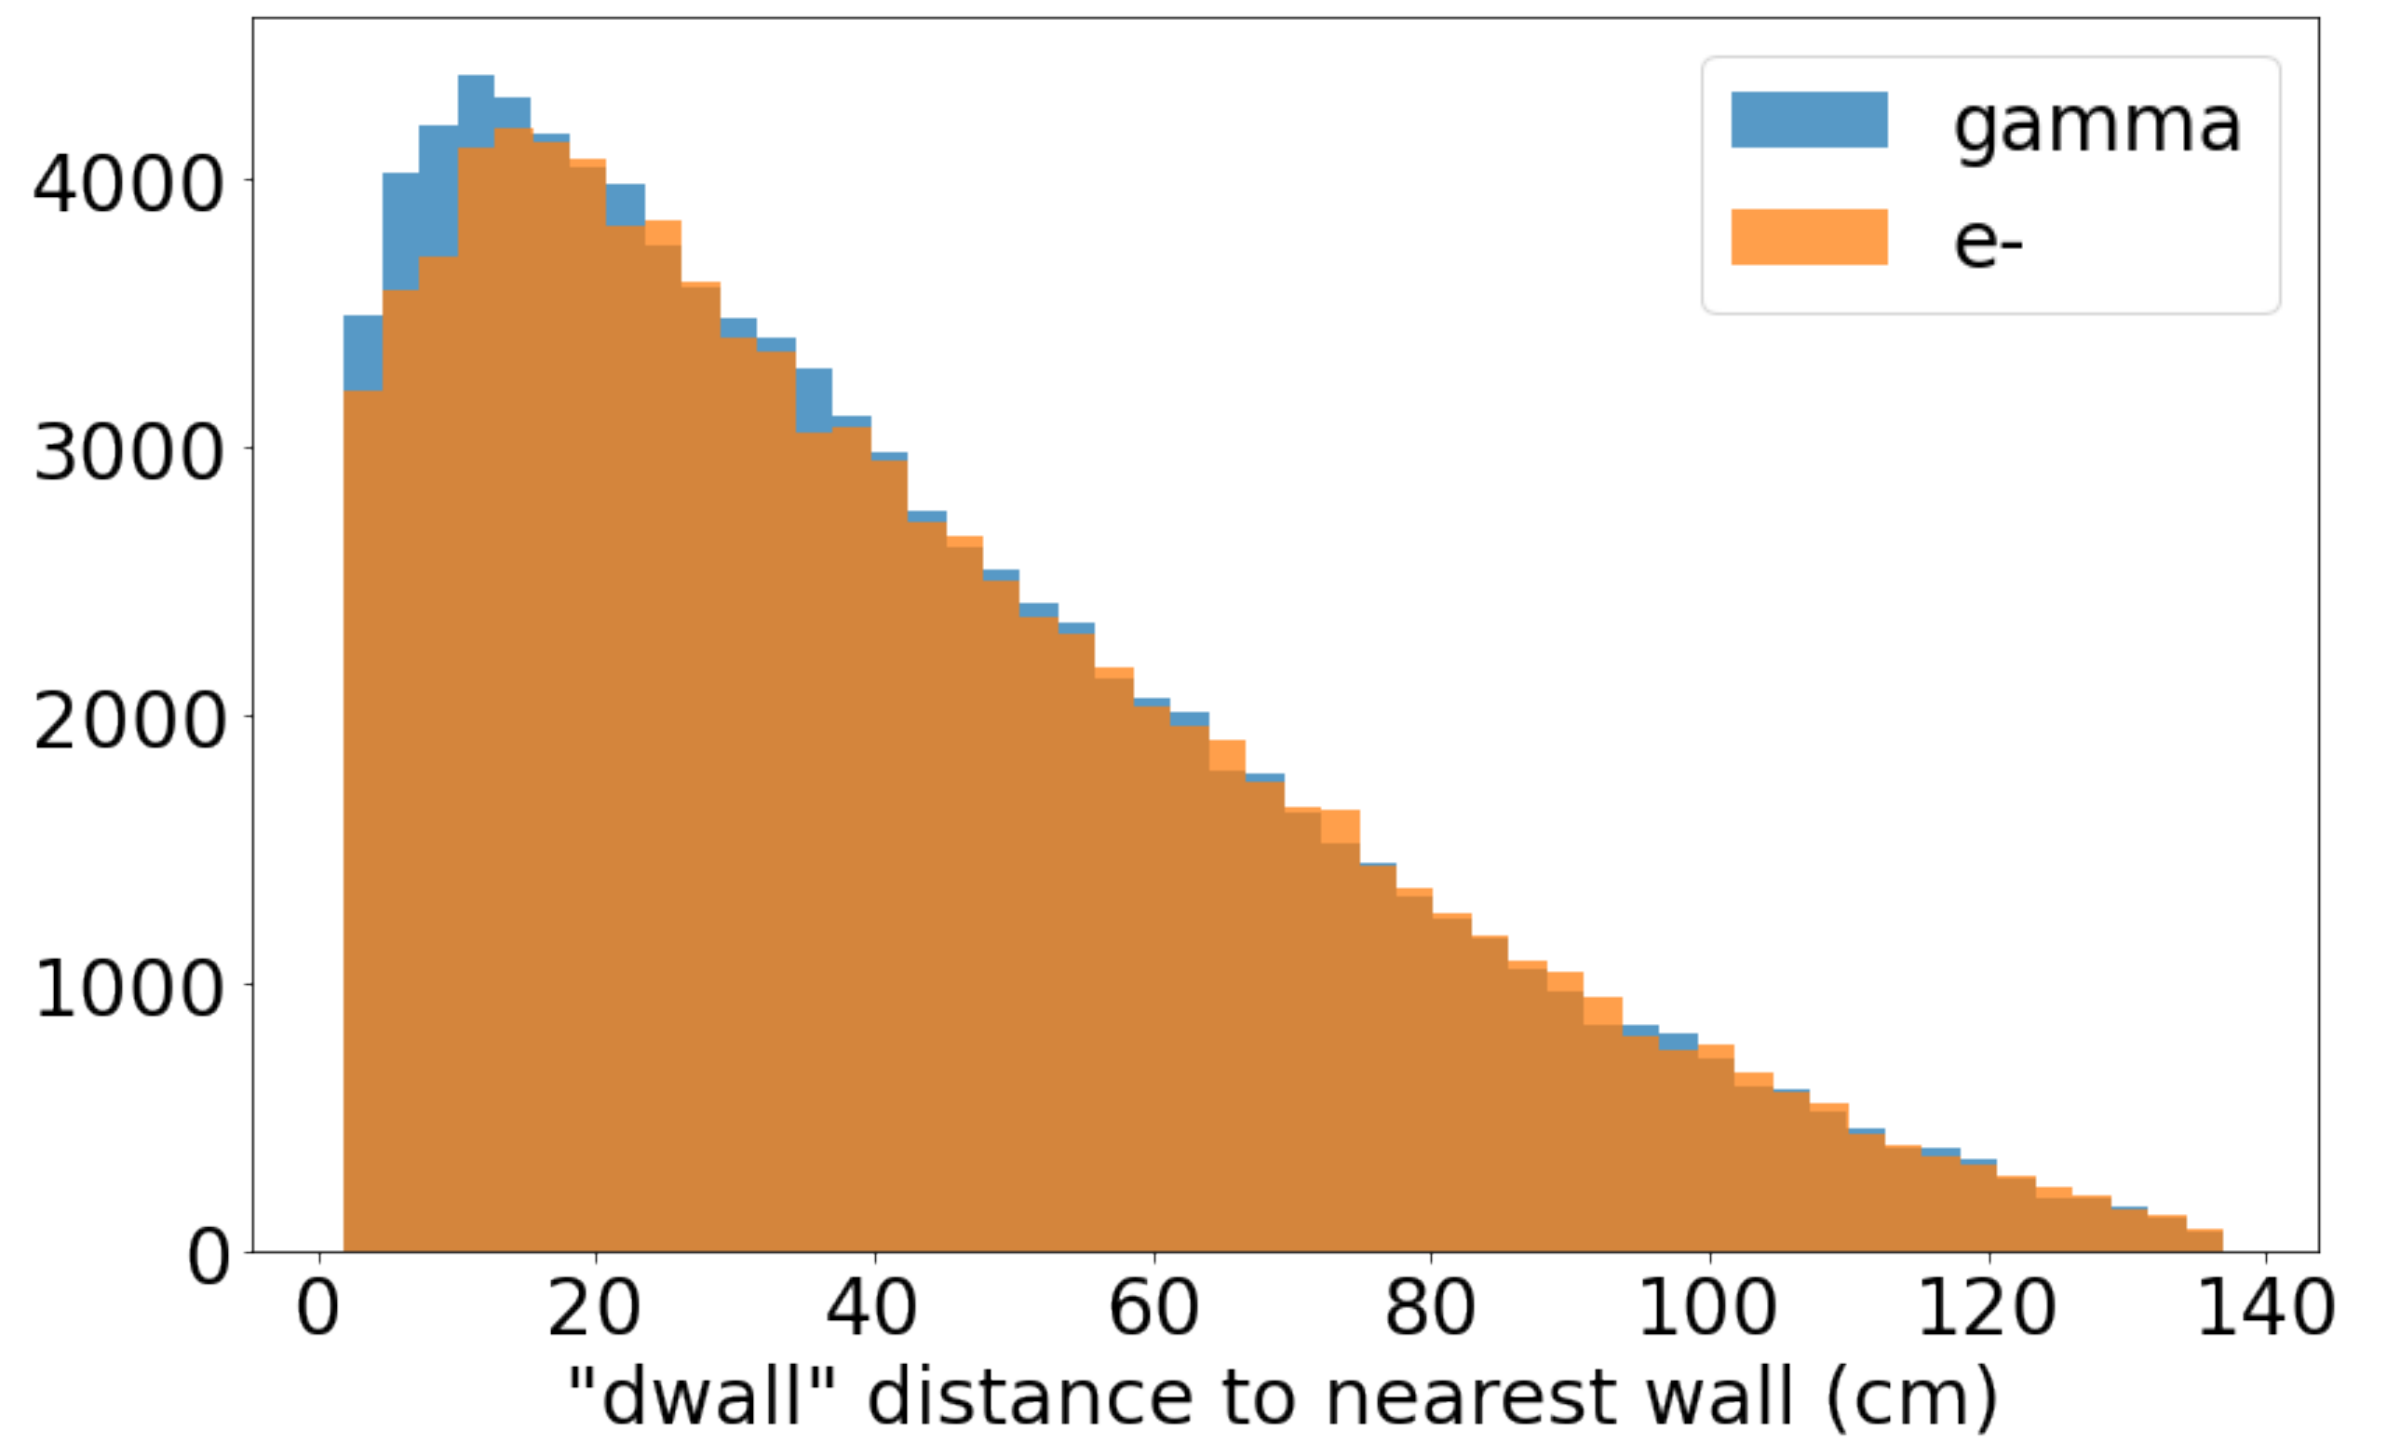

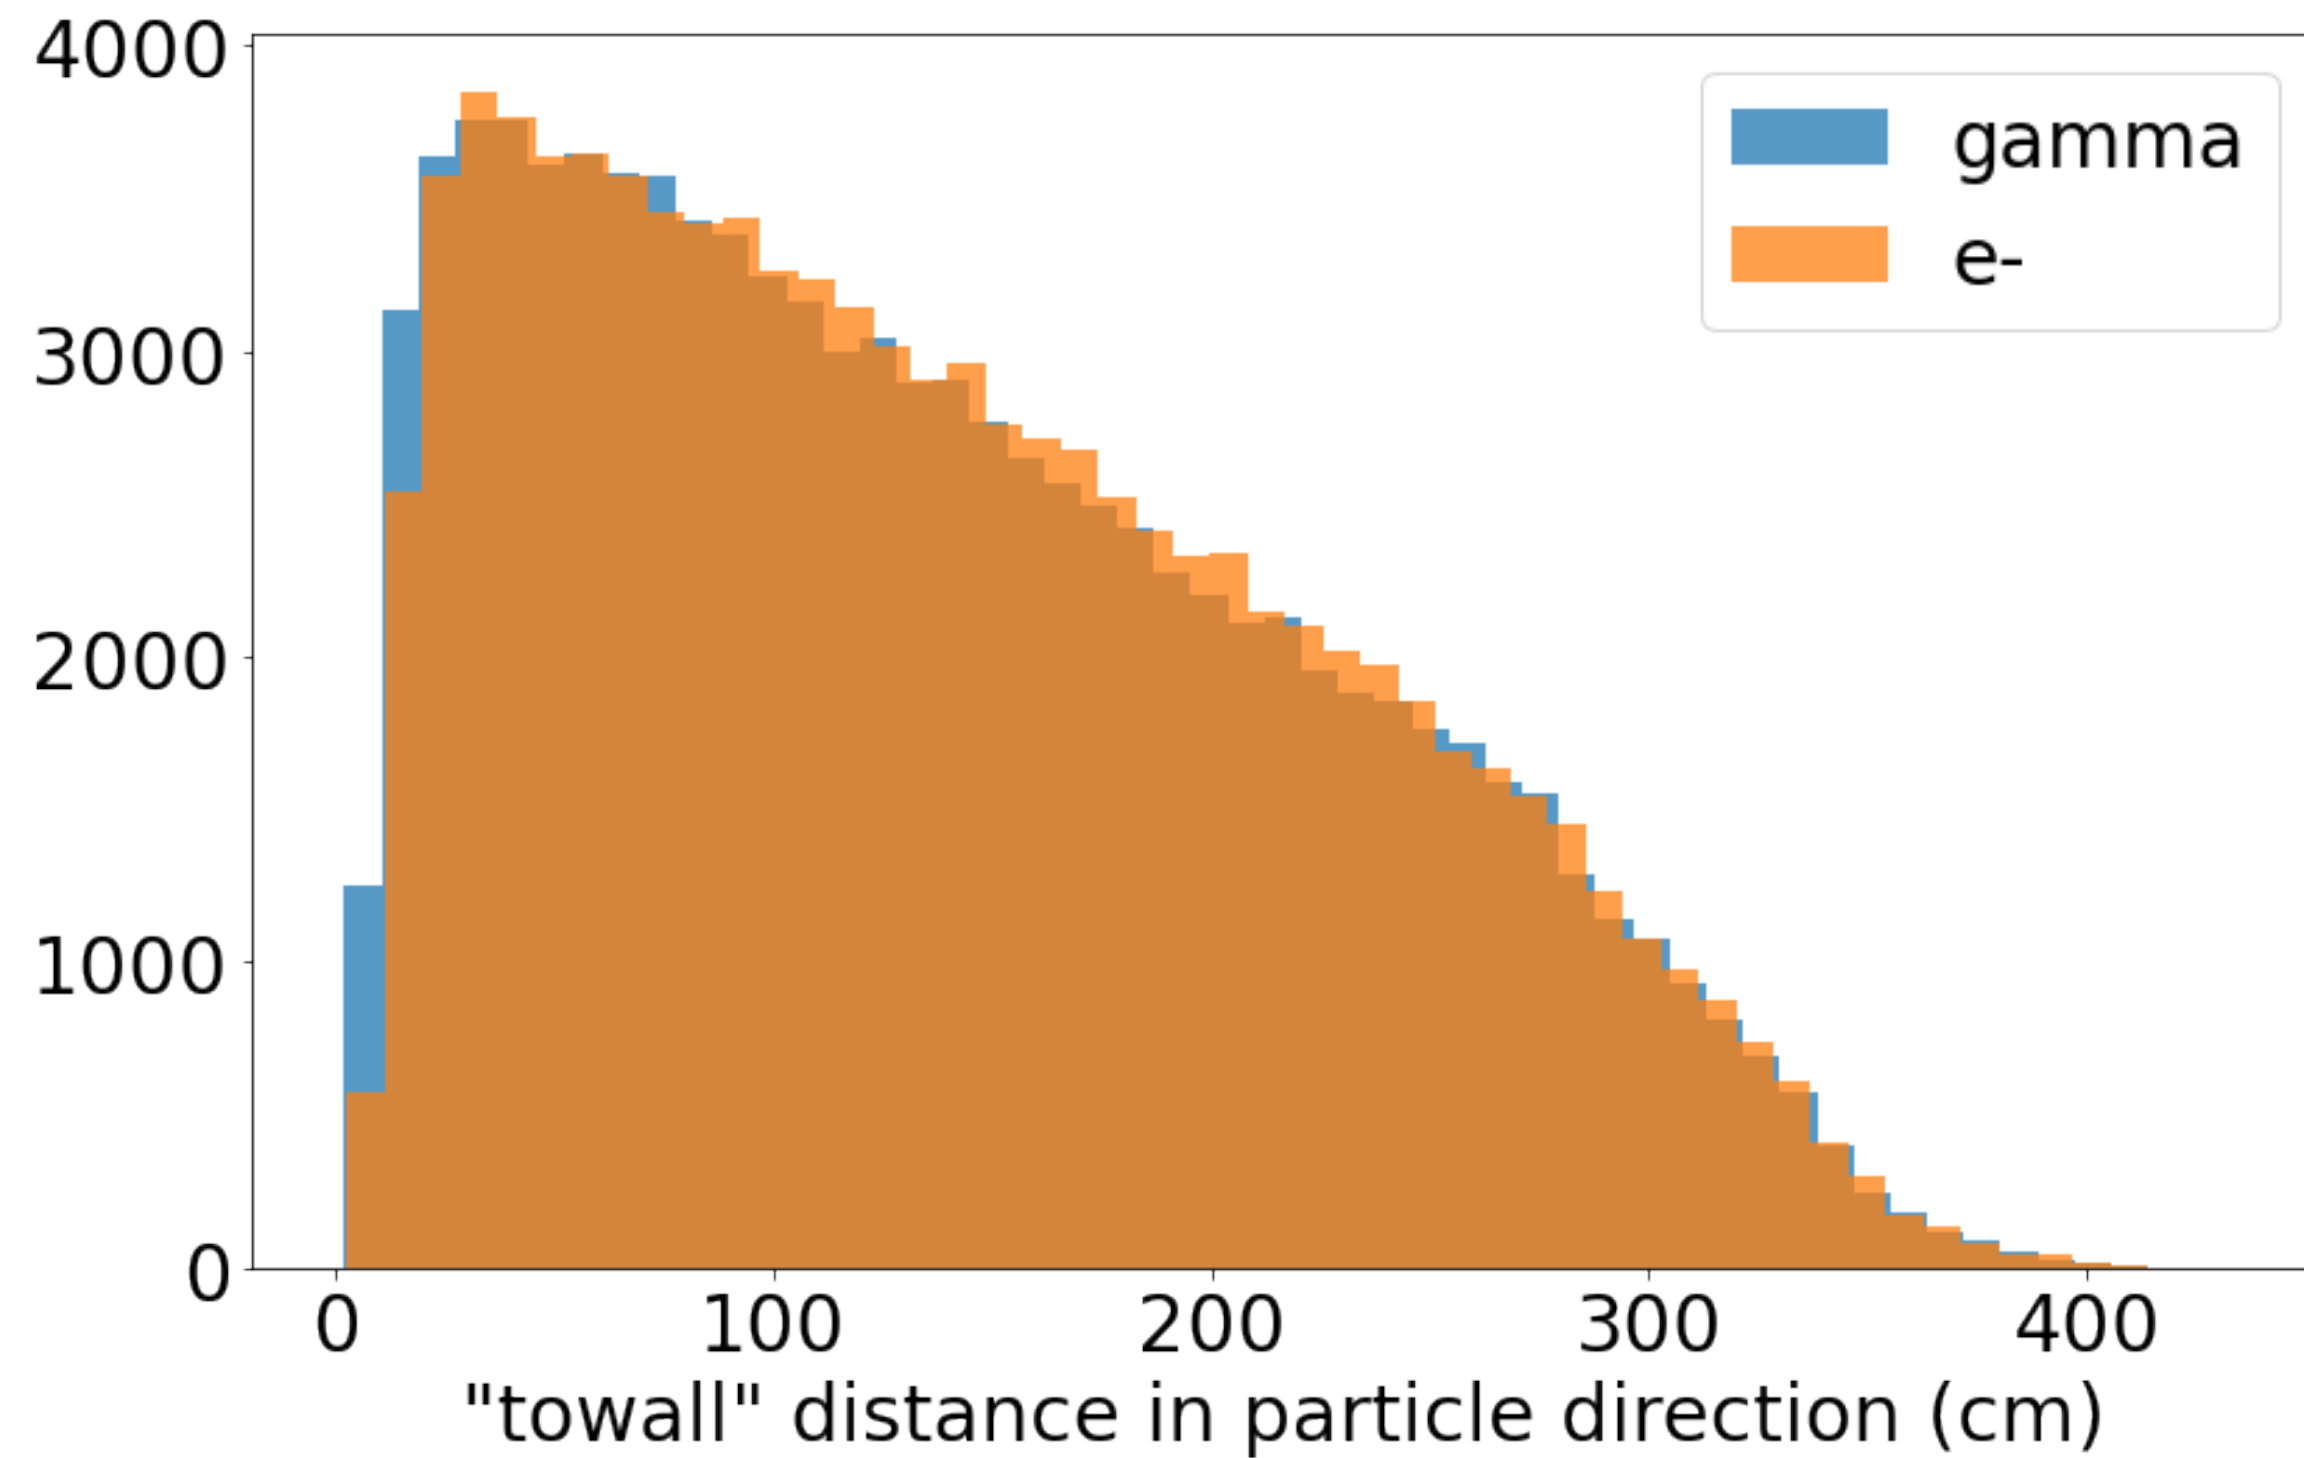

# Generation of WCSim events (1M e-/gamma):

## Distribution of directions in (x,y,z)

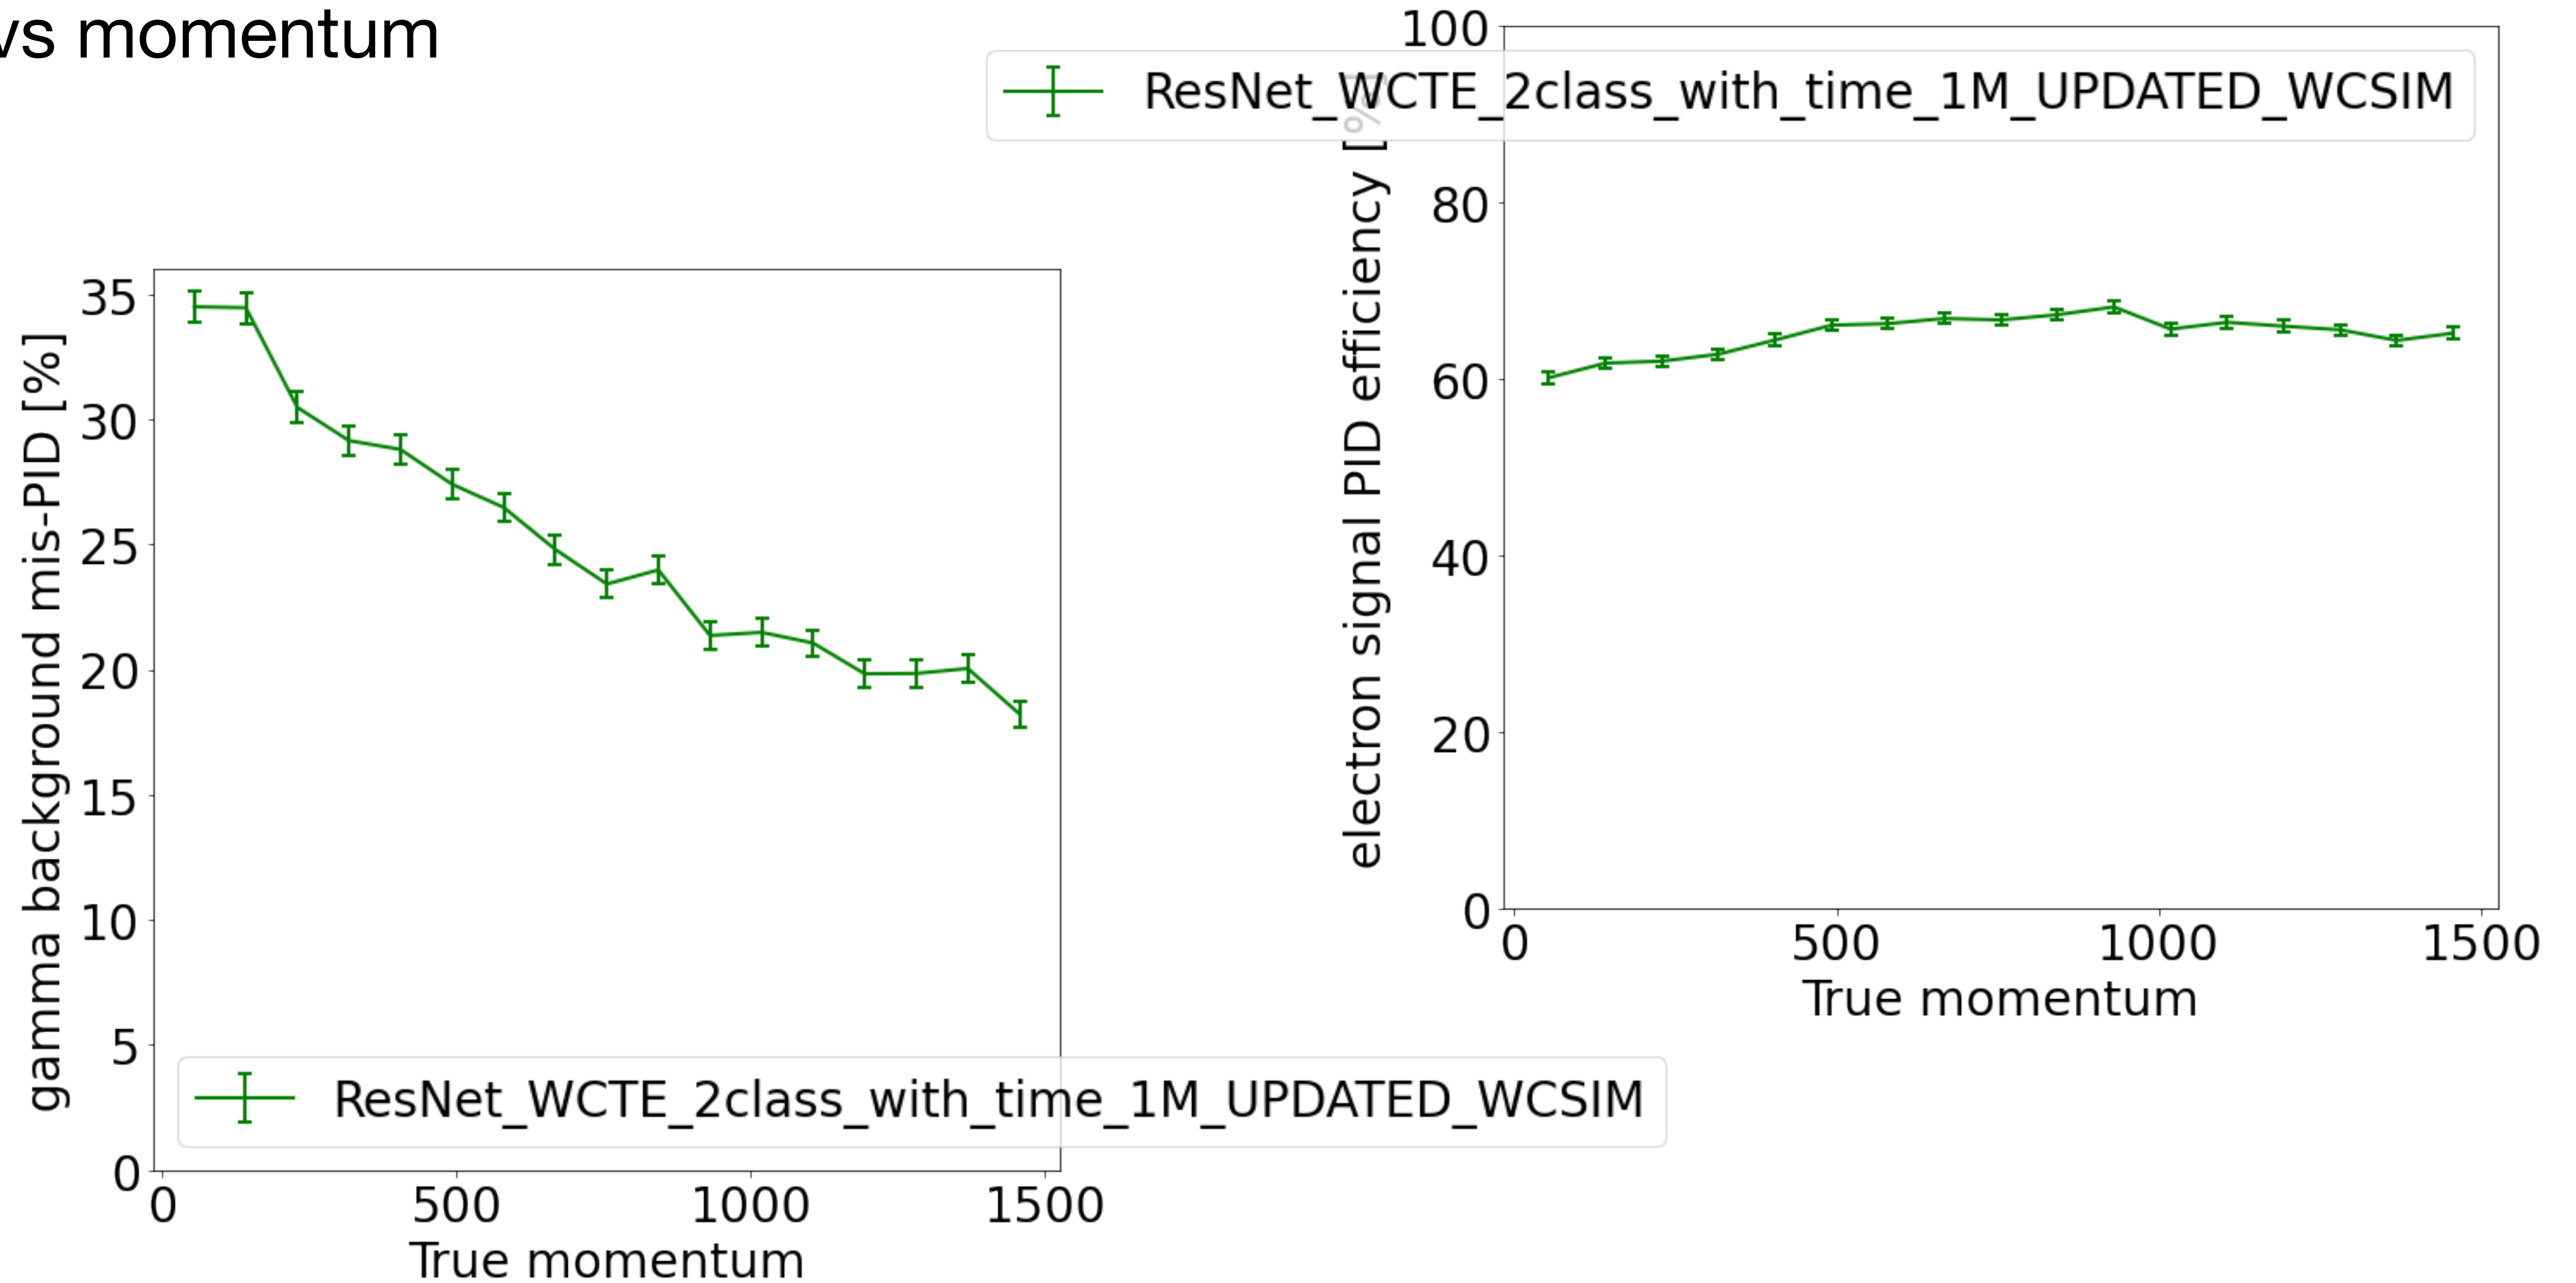

# Generation of WCSim events (1M e-/gamma):

## Distribution of distances to detector walls

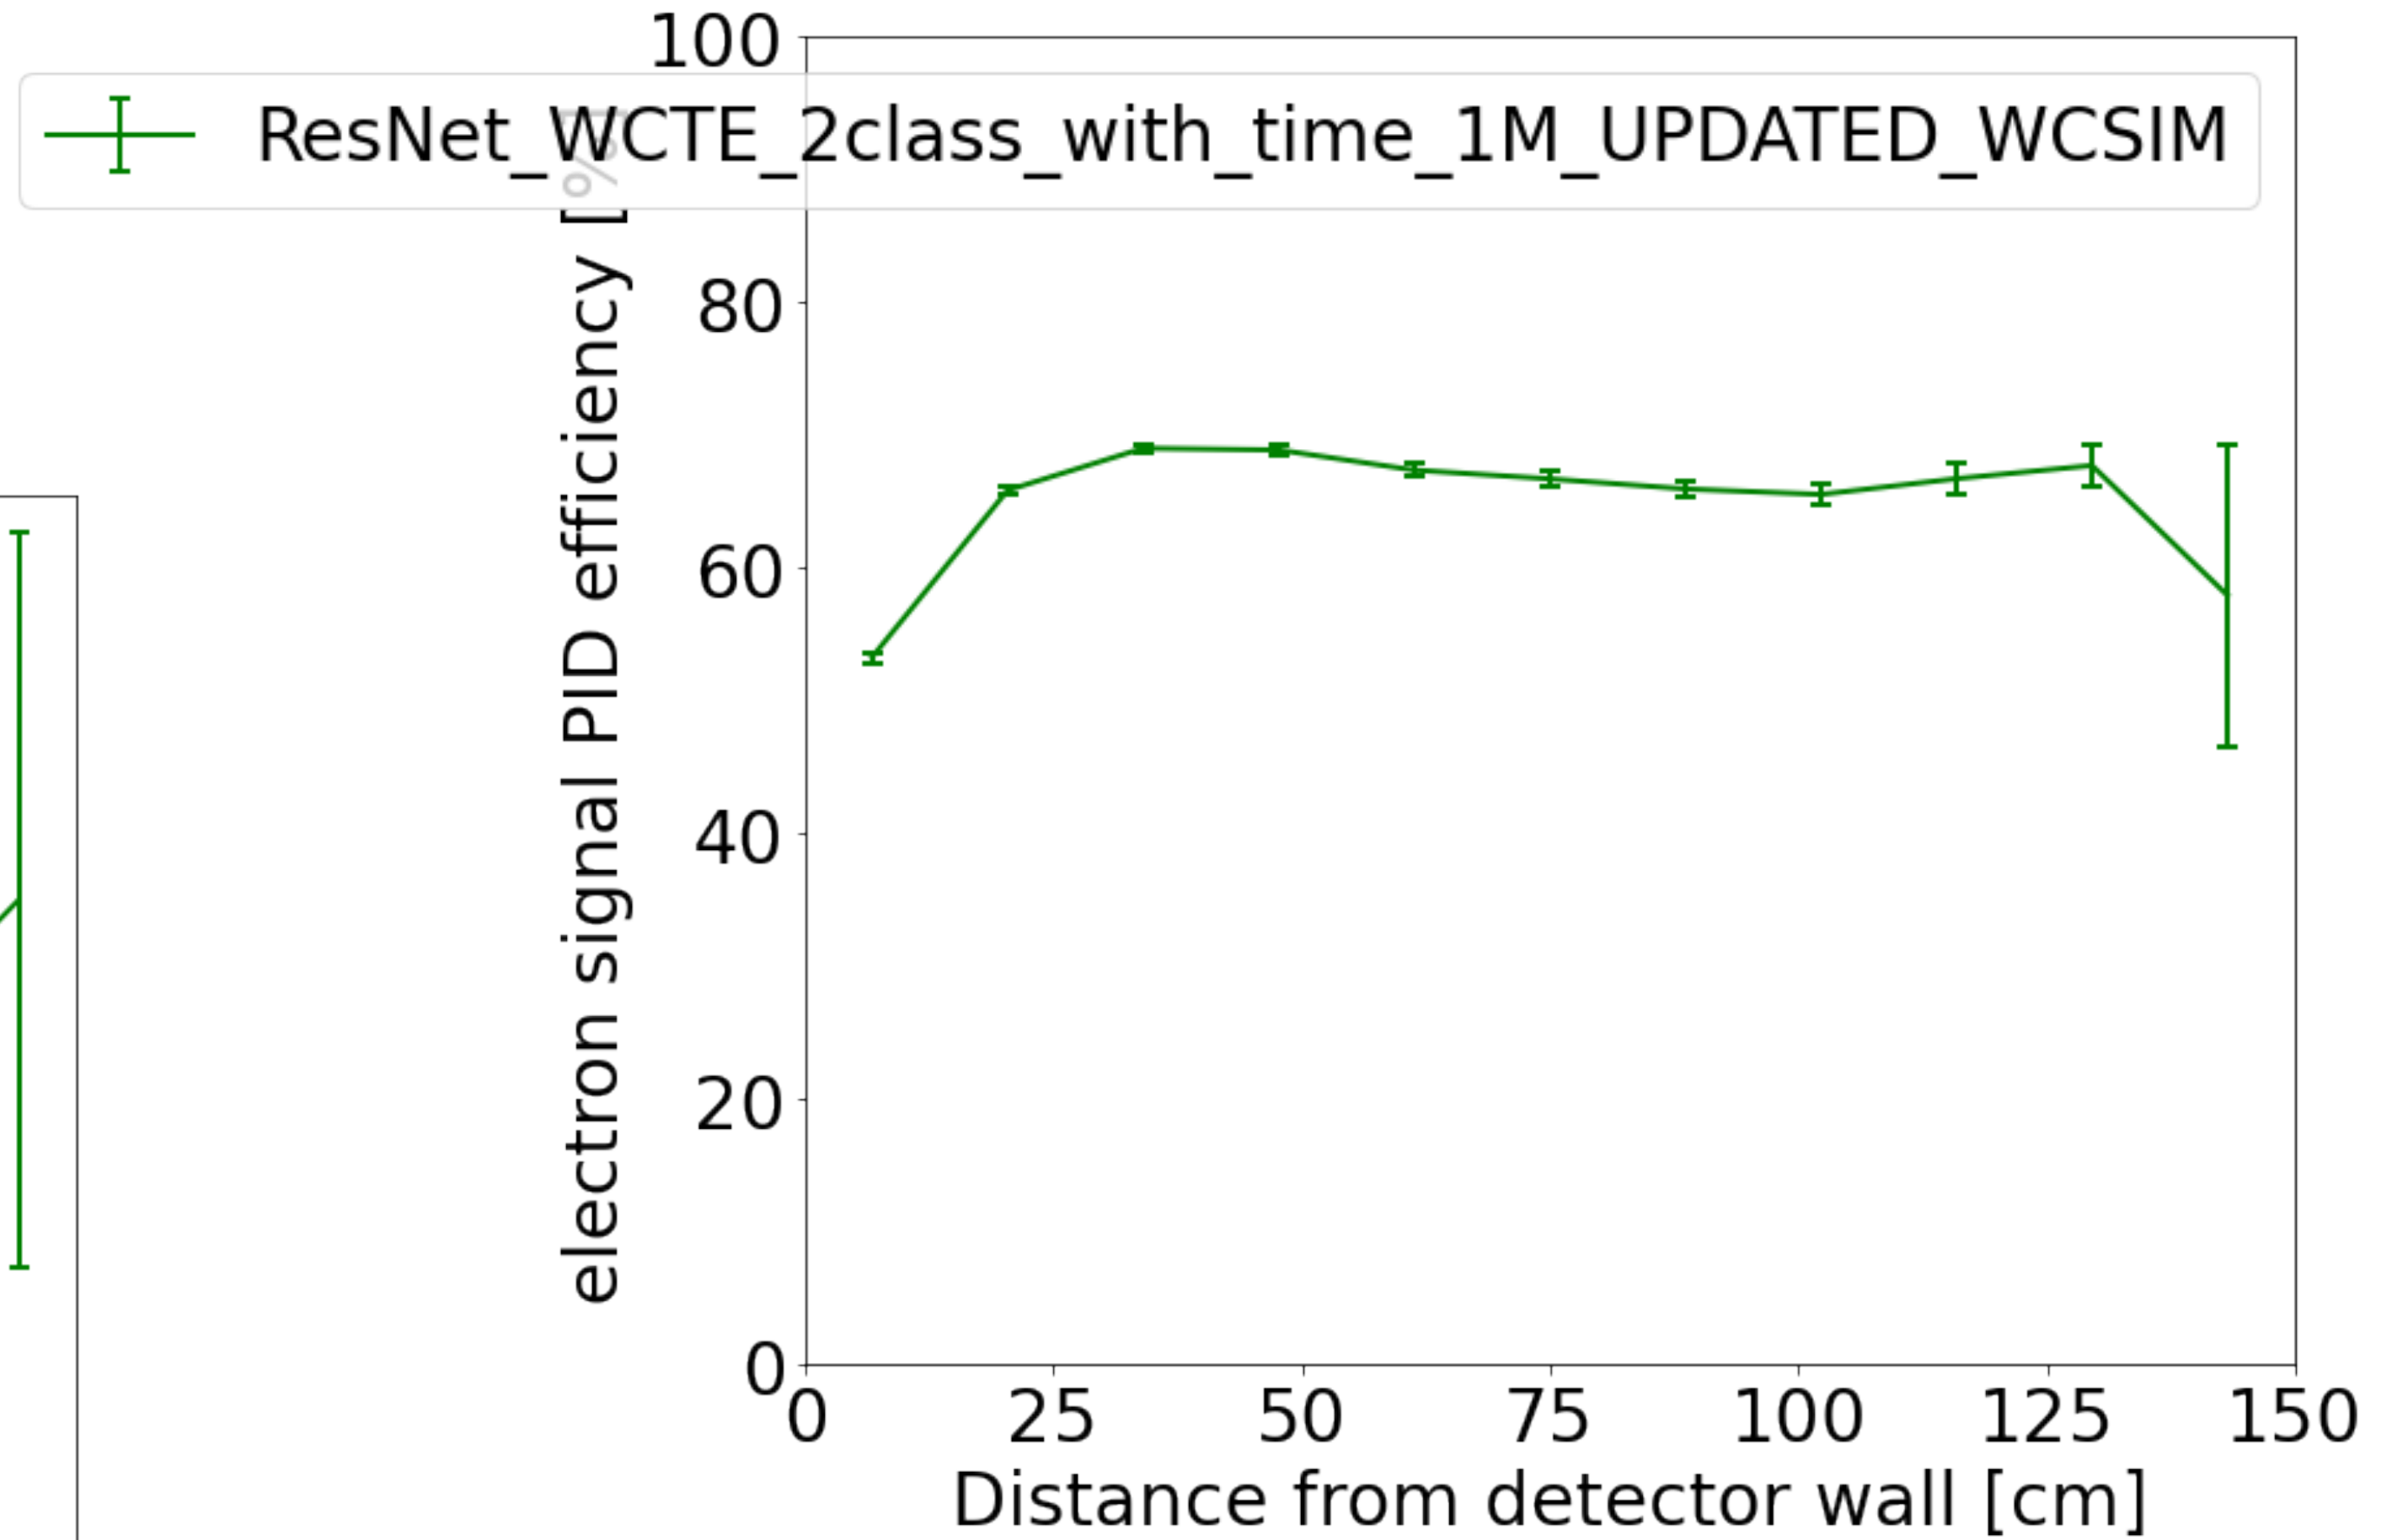

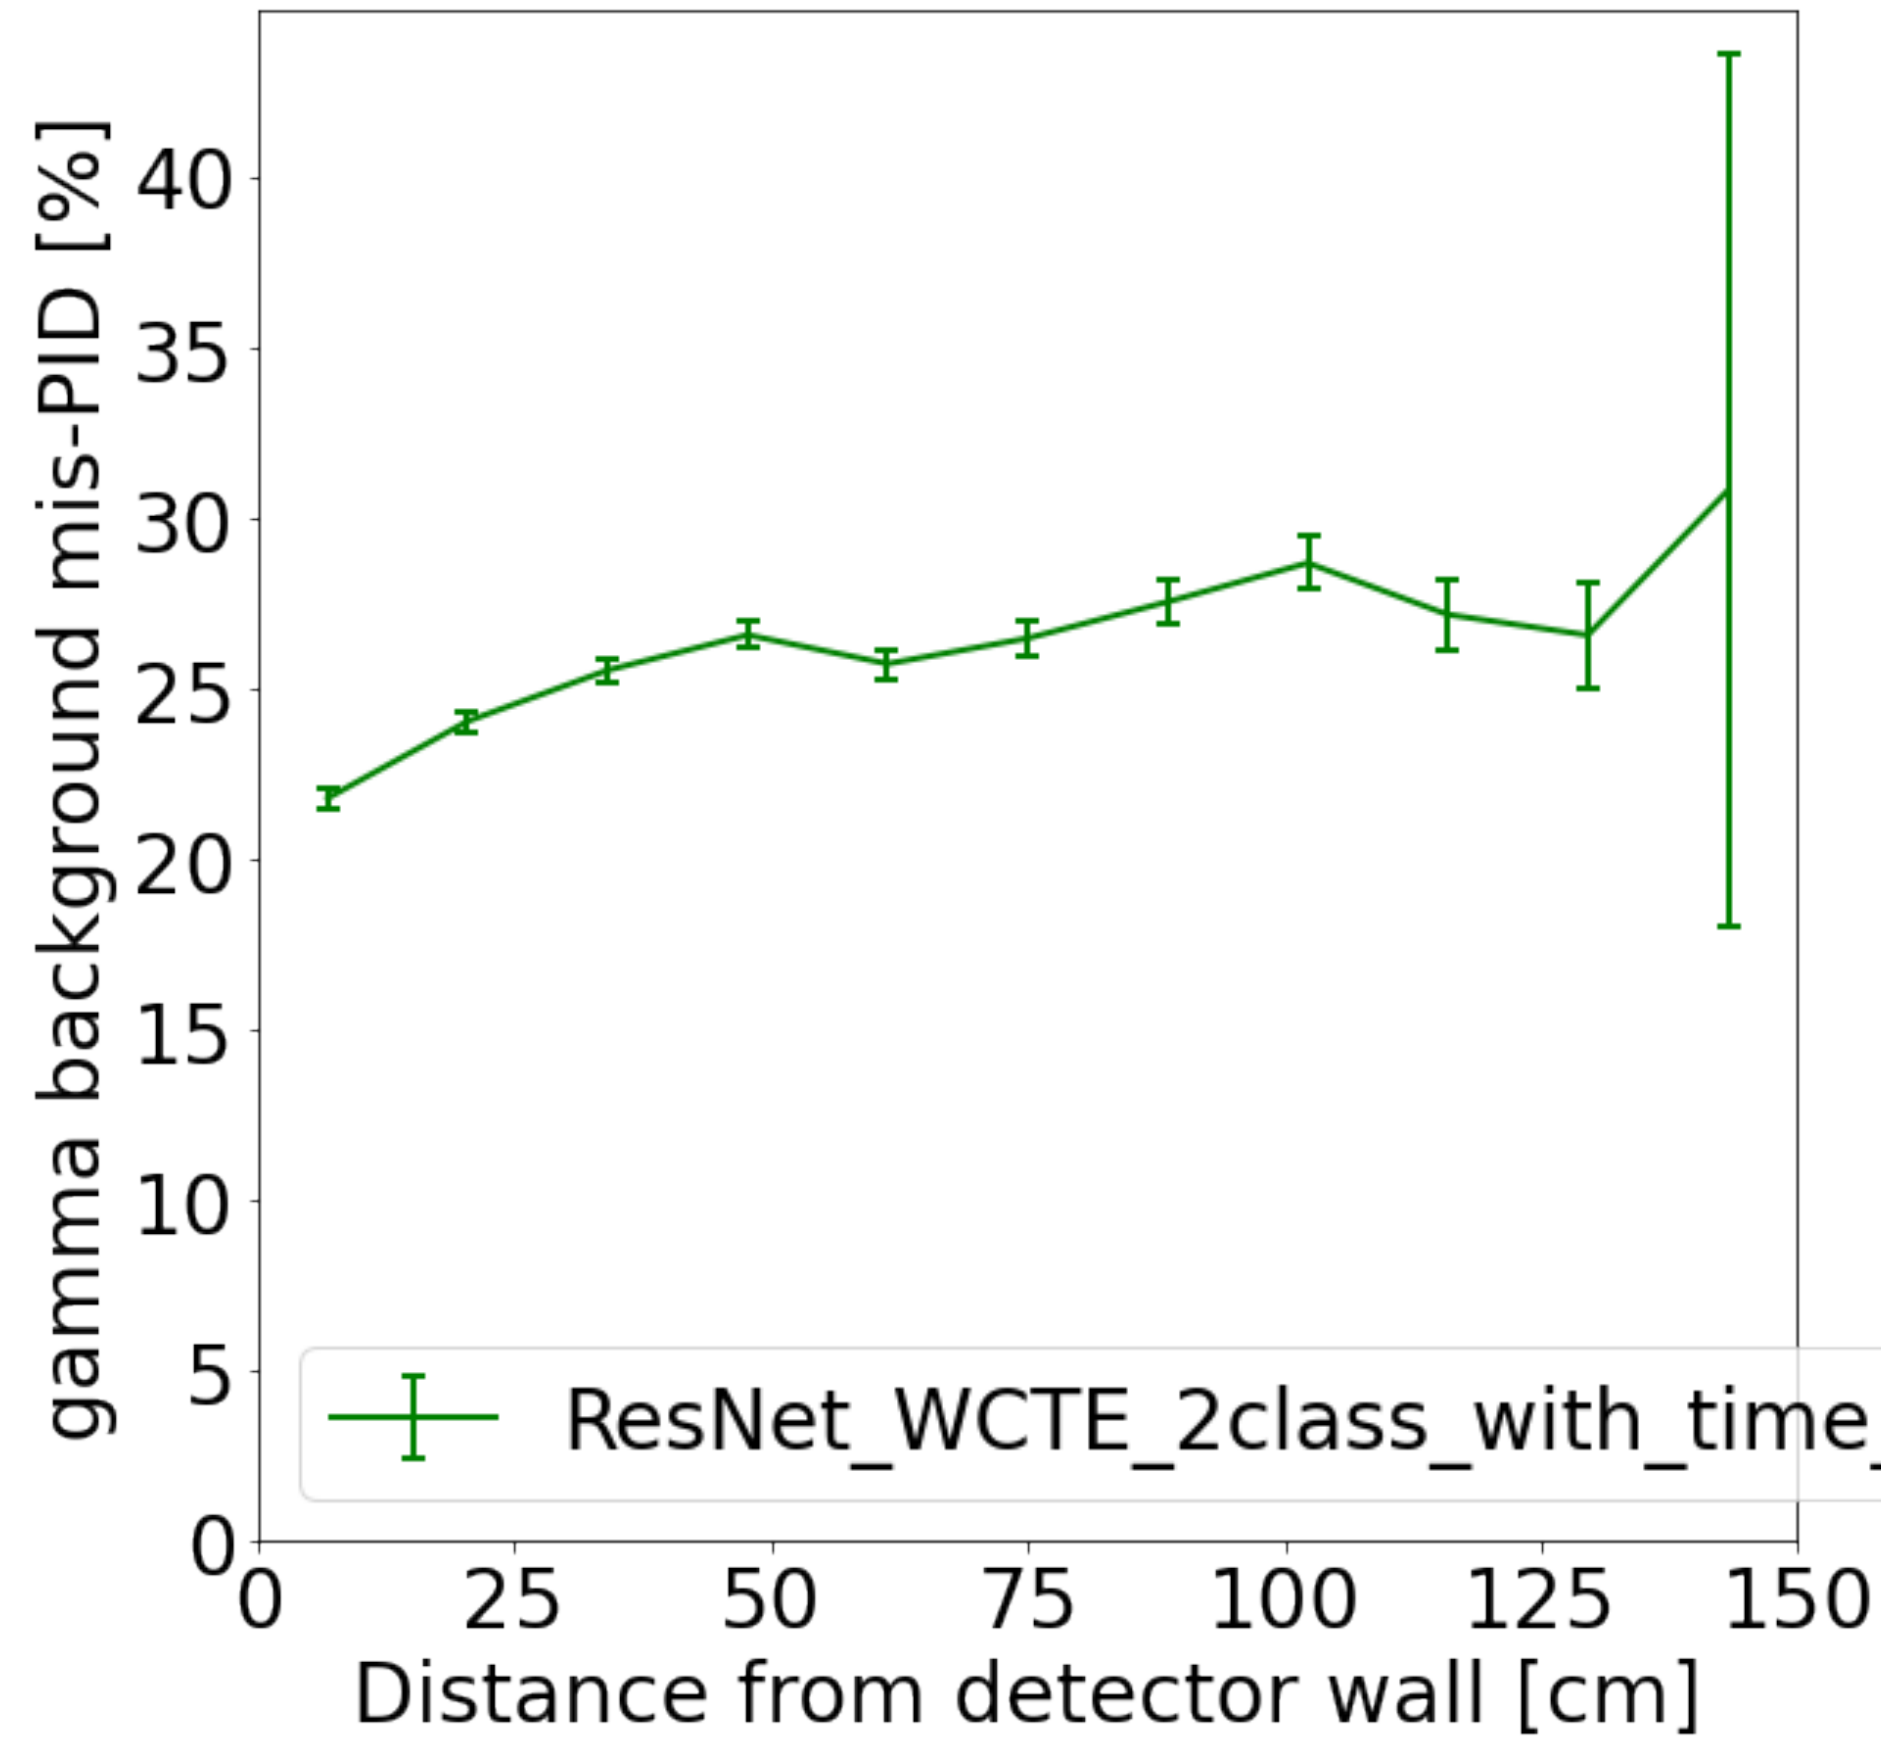

# ResNet e-/gamma signal efficiency and background mis-ID (avg. 75% background rejection):

- vs momentum

# ResNet e-/gamma signal efficiency and background mis-ID (avg. 75% background rejection):

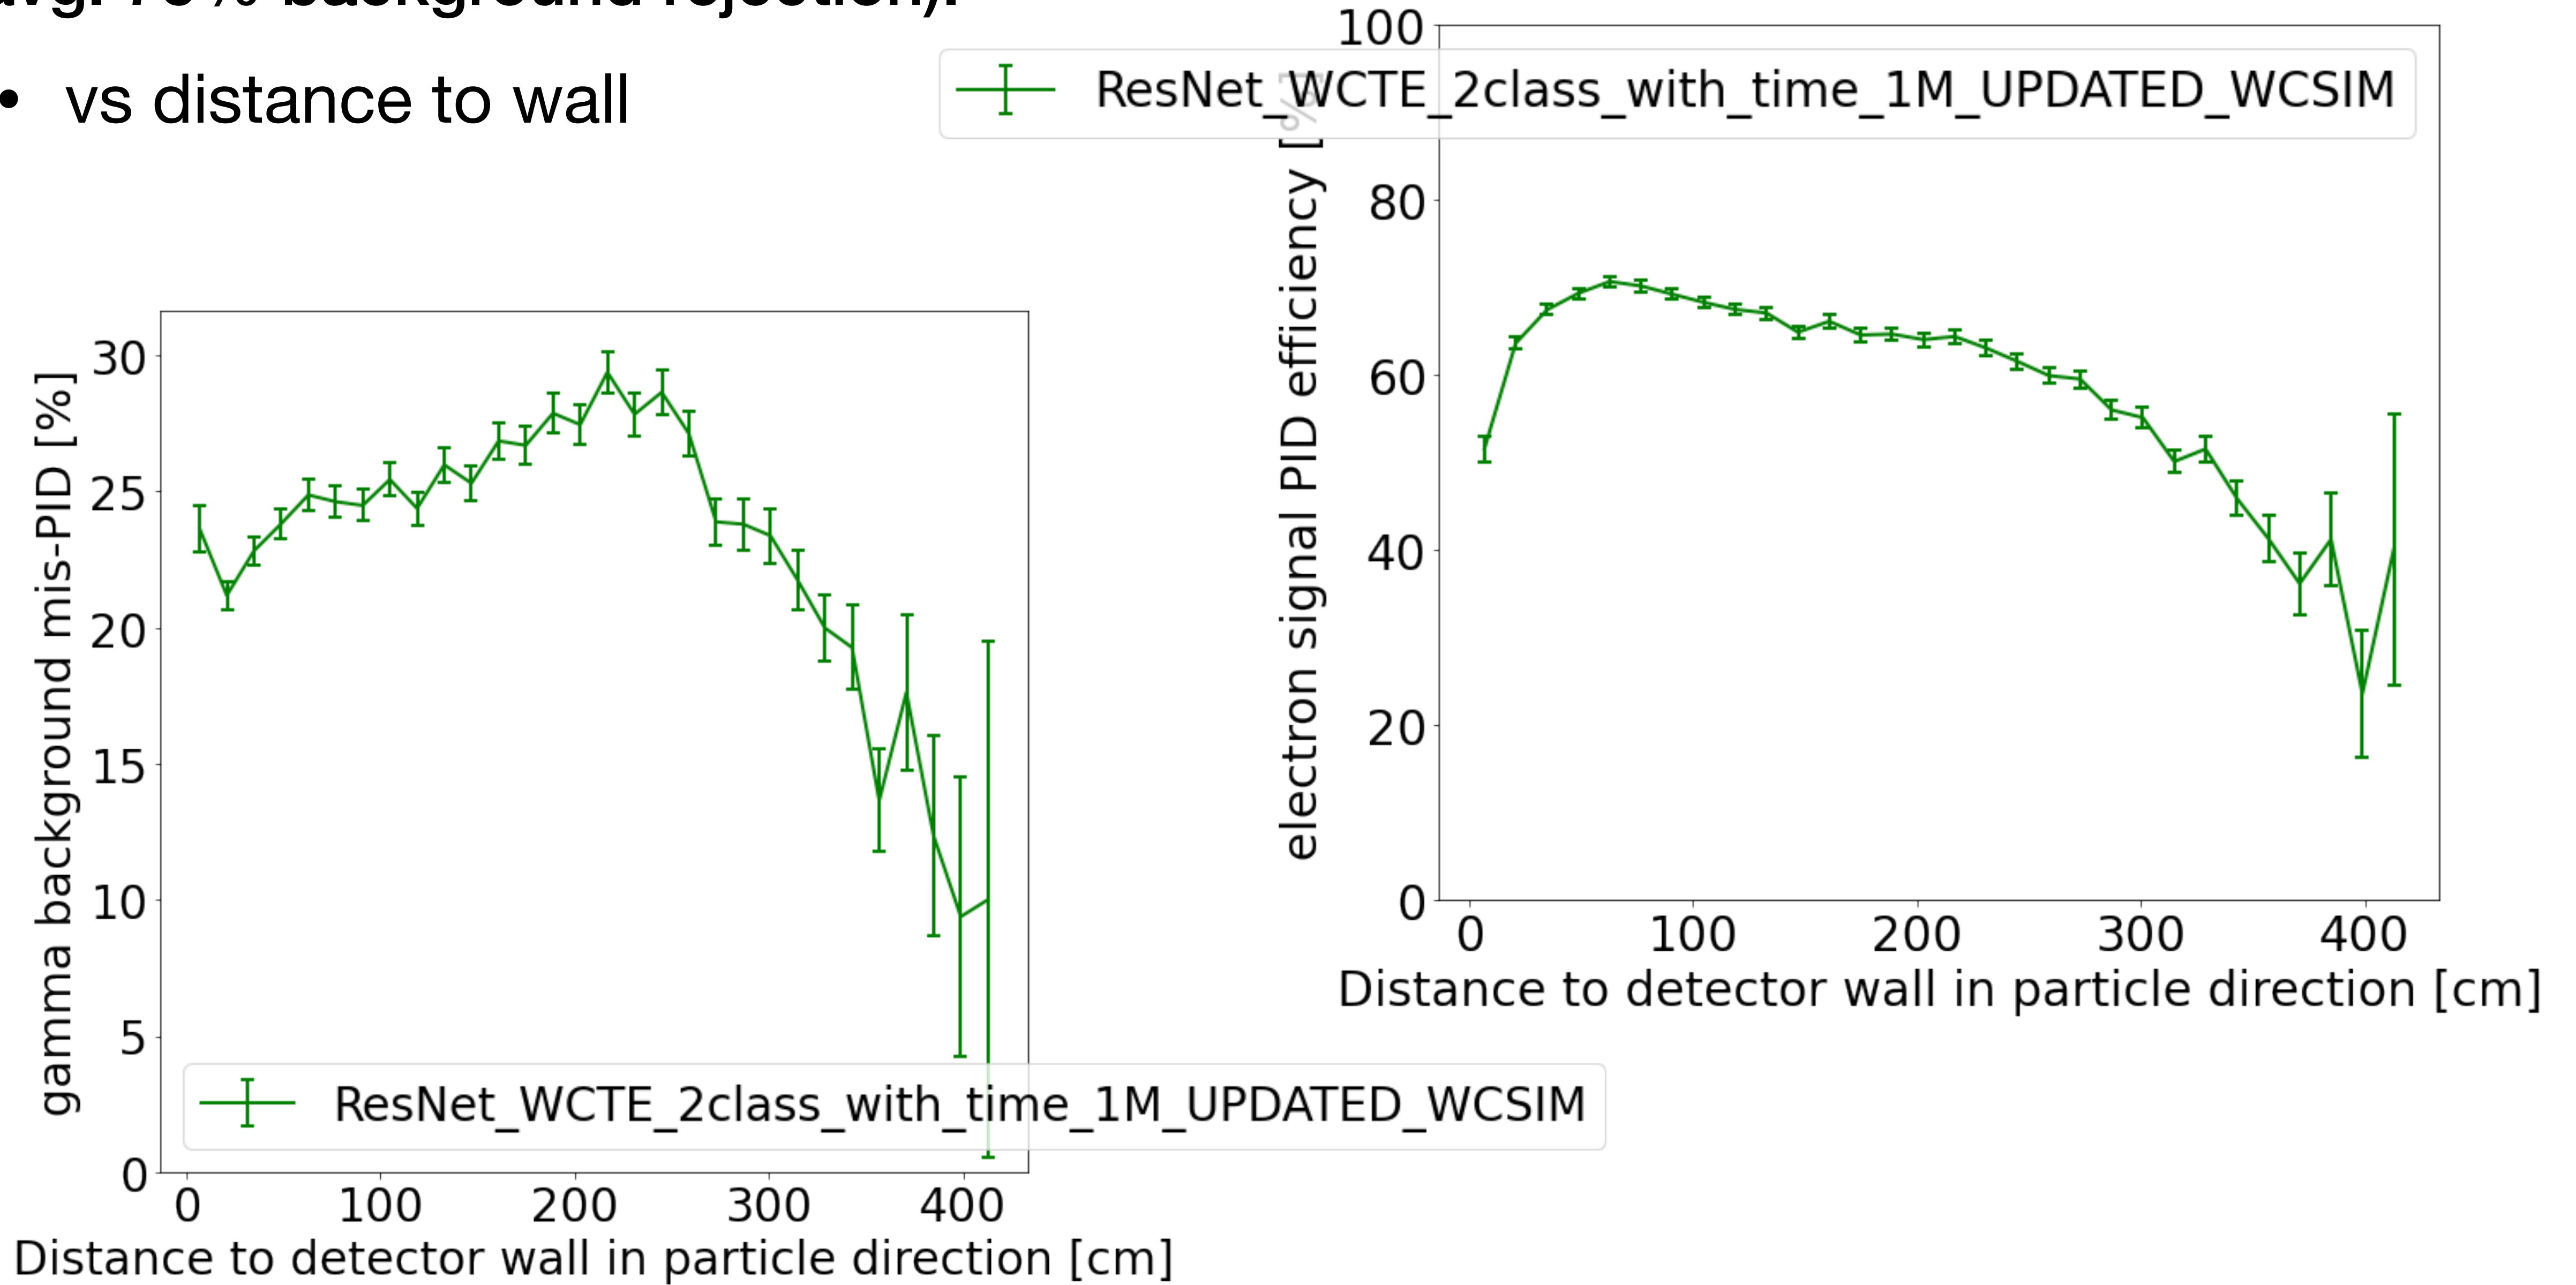

- vs distance from wall

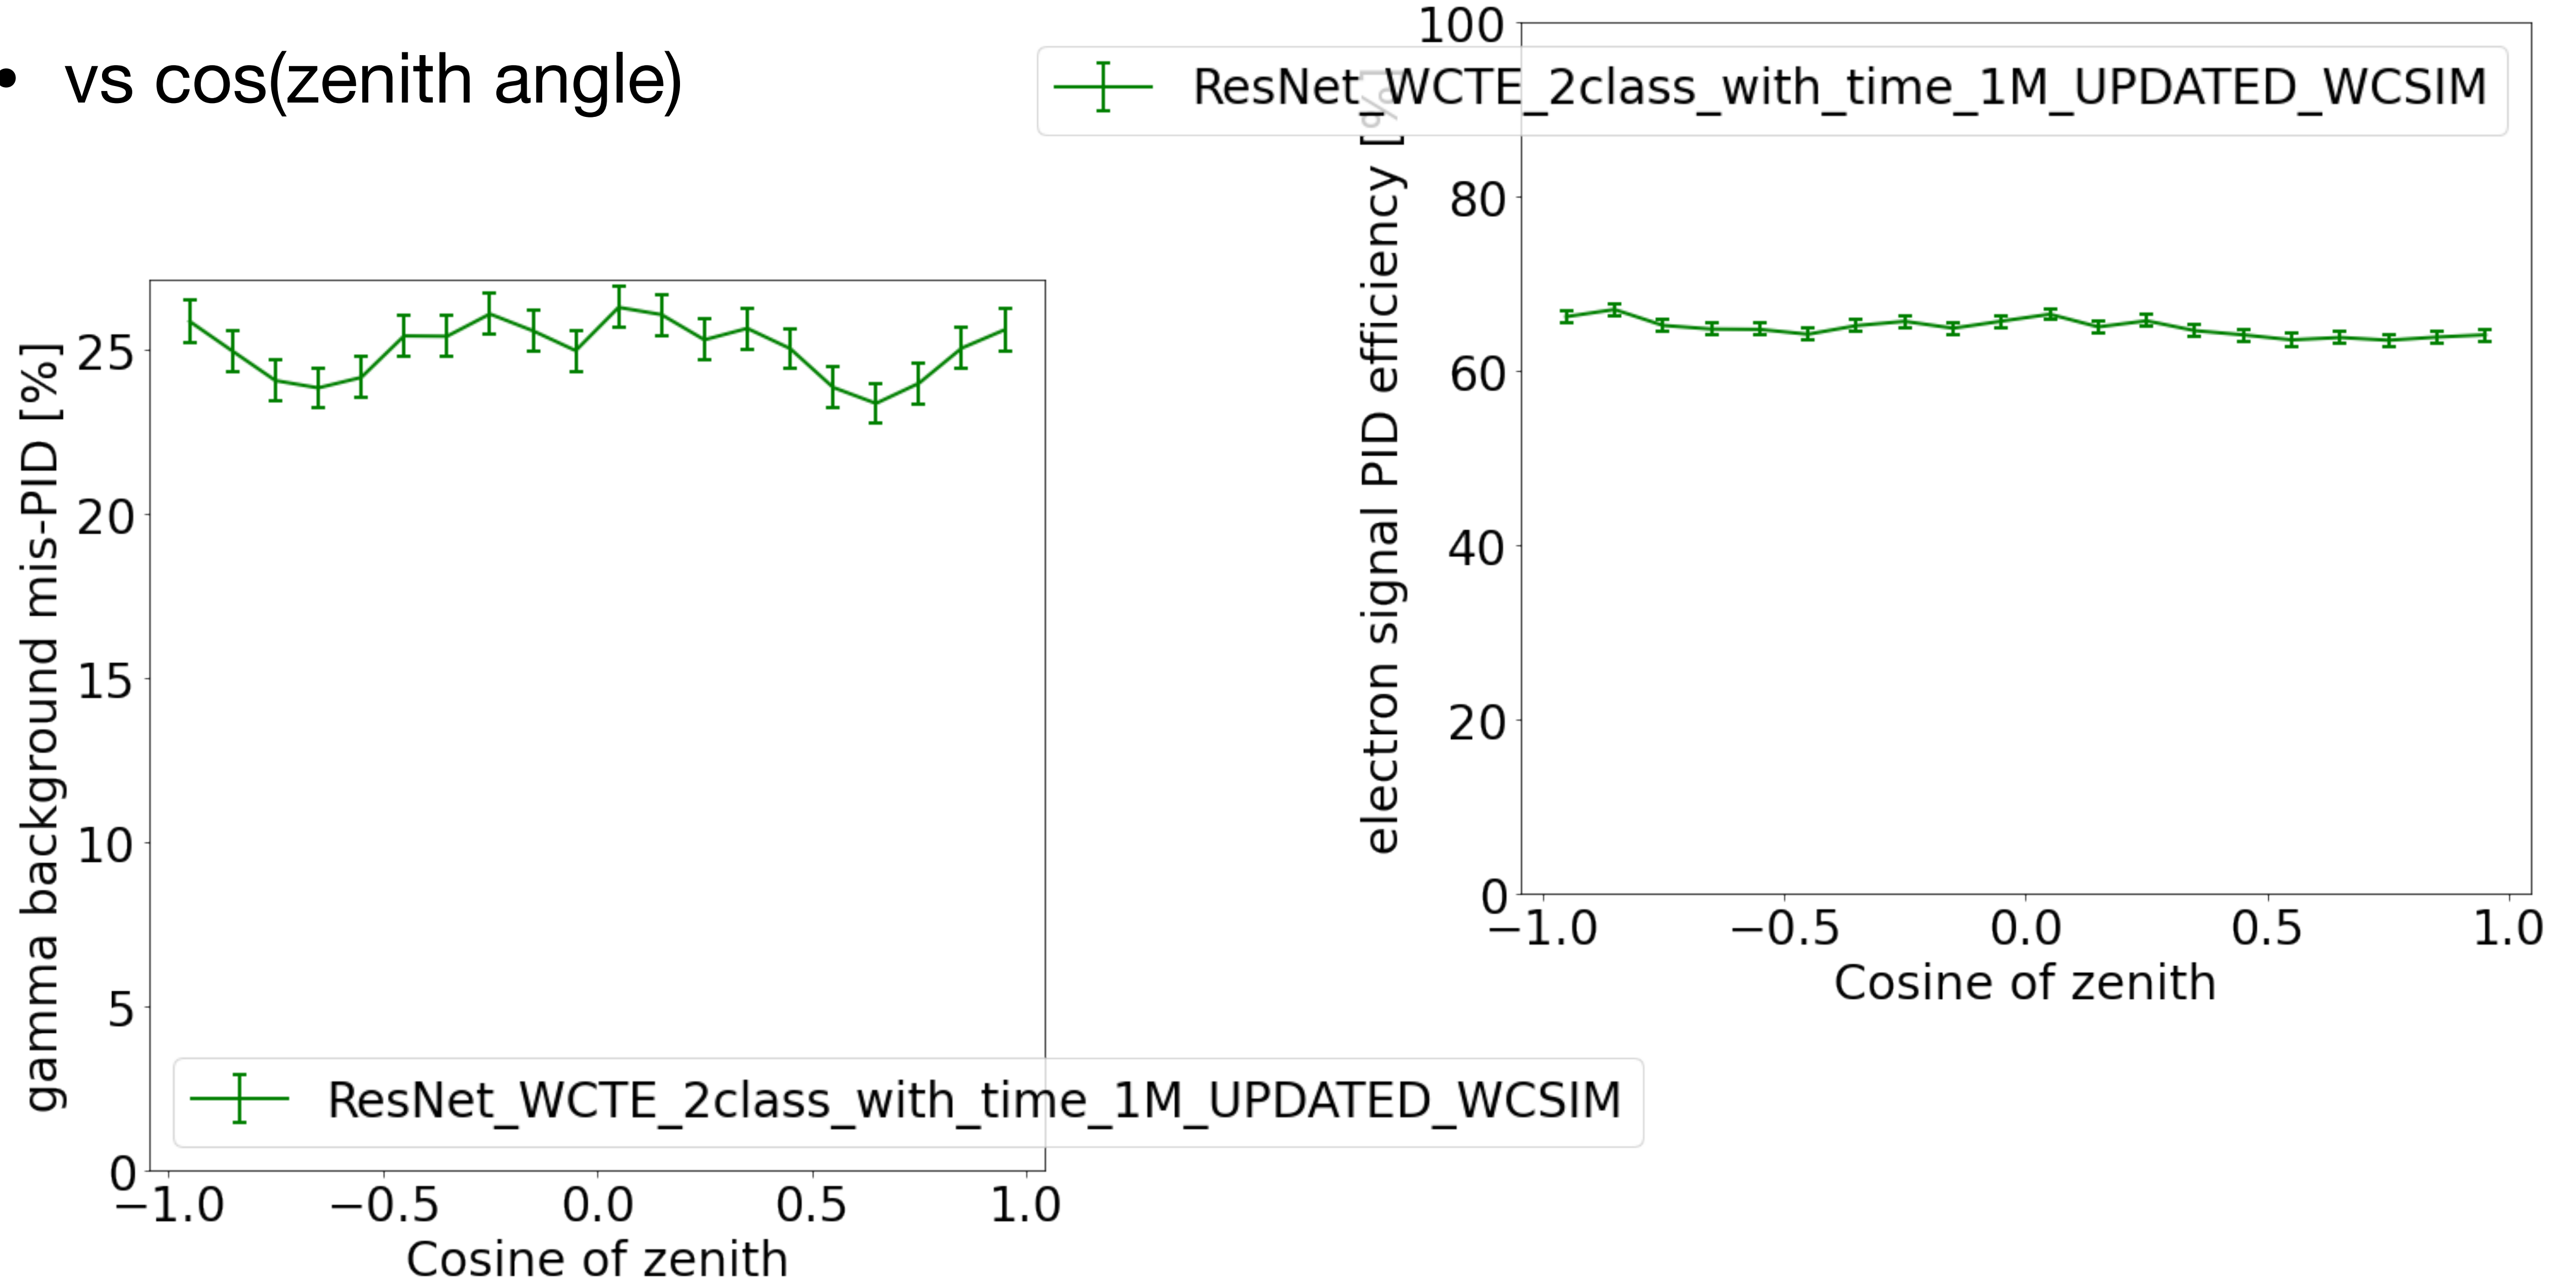

# ResNet e-/gamma signal efficiency and background mis-ID (avg. 75% background rejection):

- vs distance to wall

# ResNet e-/gamma signal efficiency and background mis-ID (avg. 75% background rejection):

- vs  $\cos(\text{zenith angle})$

# ResNet e-/gamma signal efficiency and background mis-ID (avg. 75% background rejection):

- vs azimuth angle
