

# Group Meeting

---

SFGD prototype reconstruction progress  
and some comments about TPC beam test

## SFGD

- Last WS: 3D reconstruction from 2D MPPC hits.
  - We learnt a lot about the problems that could make the 3D reconstruction difficult.
- We need some MC inputs to develop algorithms using true info vs reconstructed info.
- As presented in the last group meeting it is necessary to have both as input for Sebastian's studies.

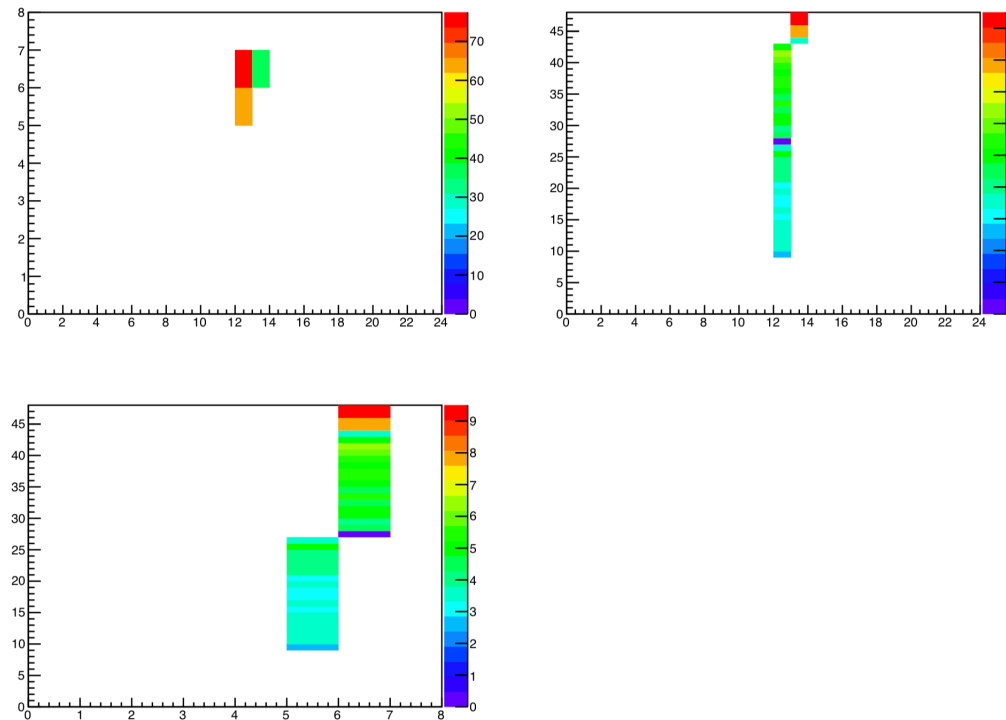

## TPC TB

- Looking forward to have final studies soon. There are still some issues to solve.

- Started to work on a 24x8x48 cubes prototype in SFGD

- I had last weeks some events and plotted them in projections. **Without detector effects!**

## Recent progress:

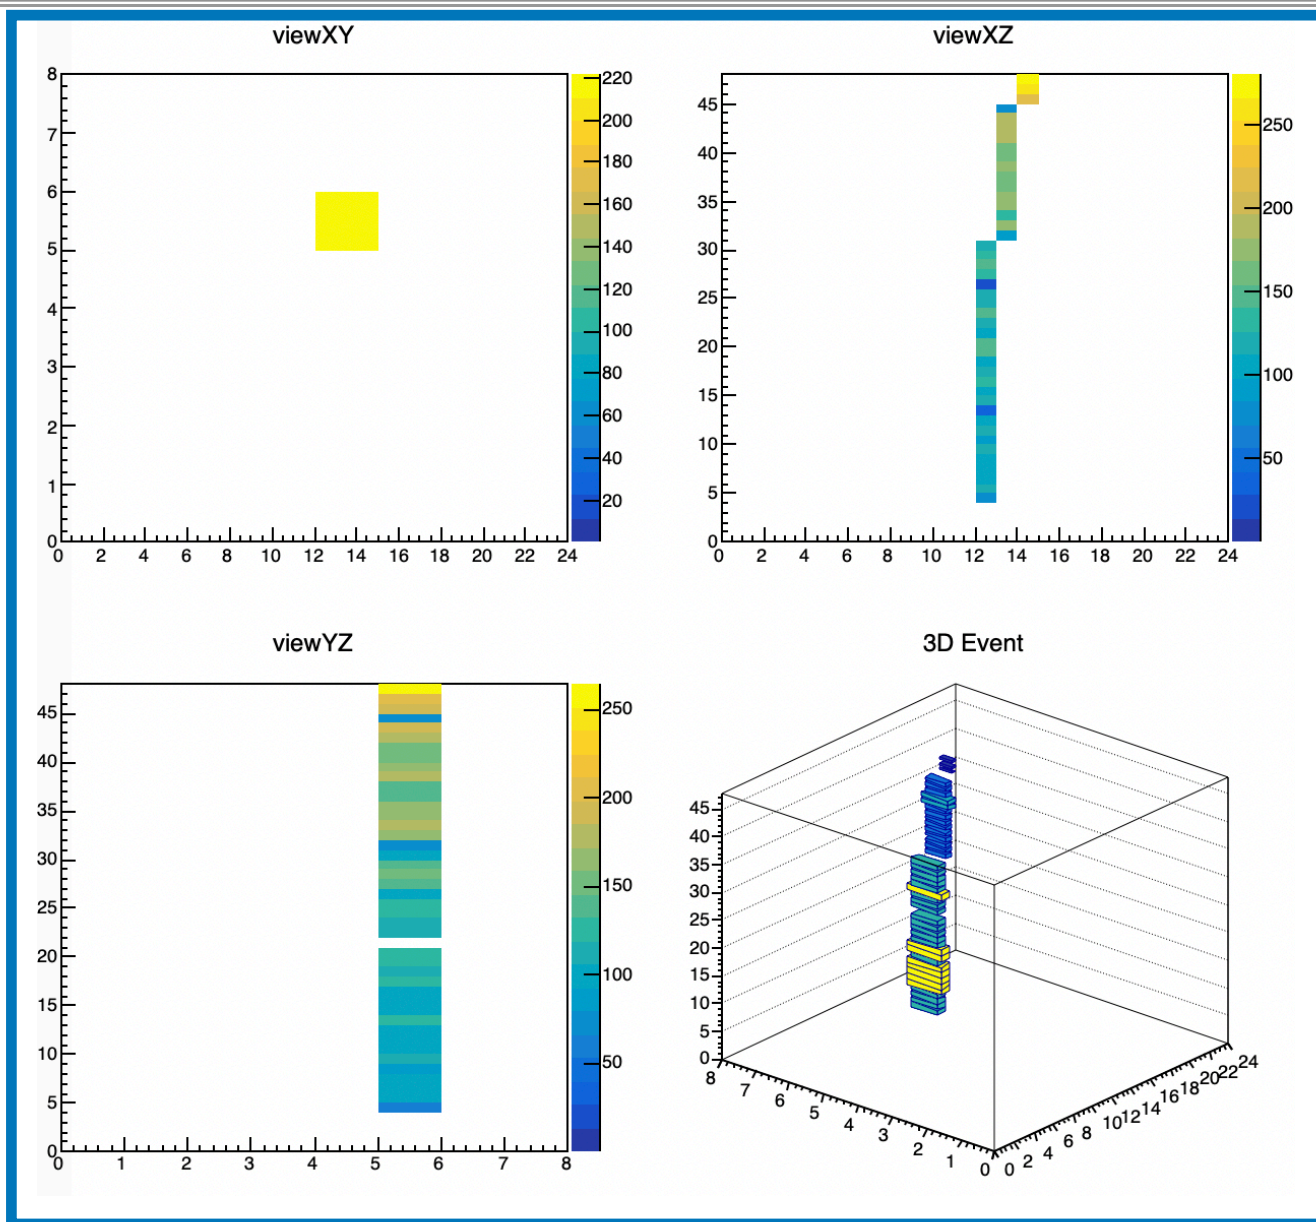

- L.Y studies included. Now we have #p.e.
- Event and Hit classes developed for the SFGD TB data storage have been included in the T2K-ND280Up software.
- Successfully stored data from MC in the same structure than real data.
- Merging hits in different projections implemented.

## A bunch of easy to develop ideas:

- Think how to store **true** information (and implement it).
- Look to distribution of time in each projection in real data and apply it to MC. (some random conditions option?)
- Apply crosstalk.
- Check 2D to 3D algorithm with true information.

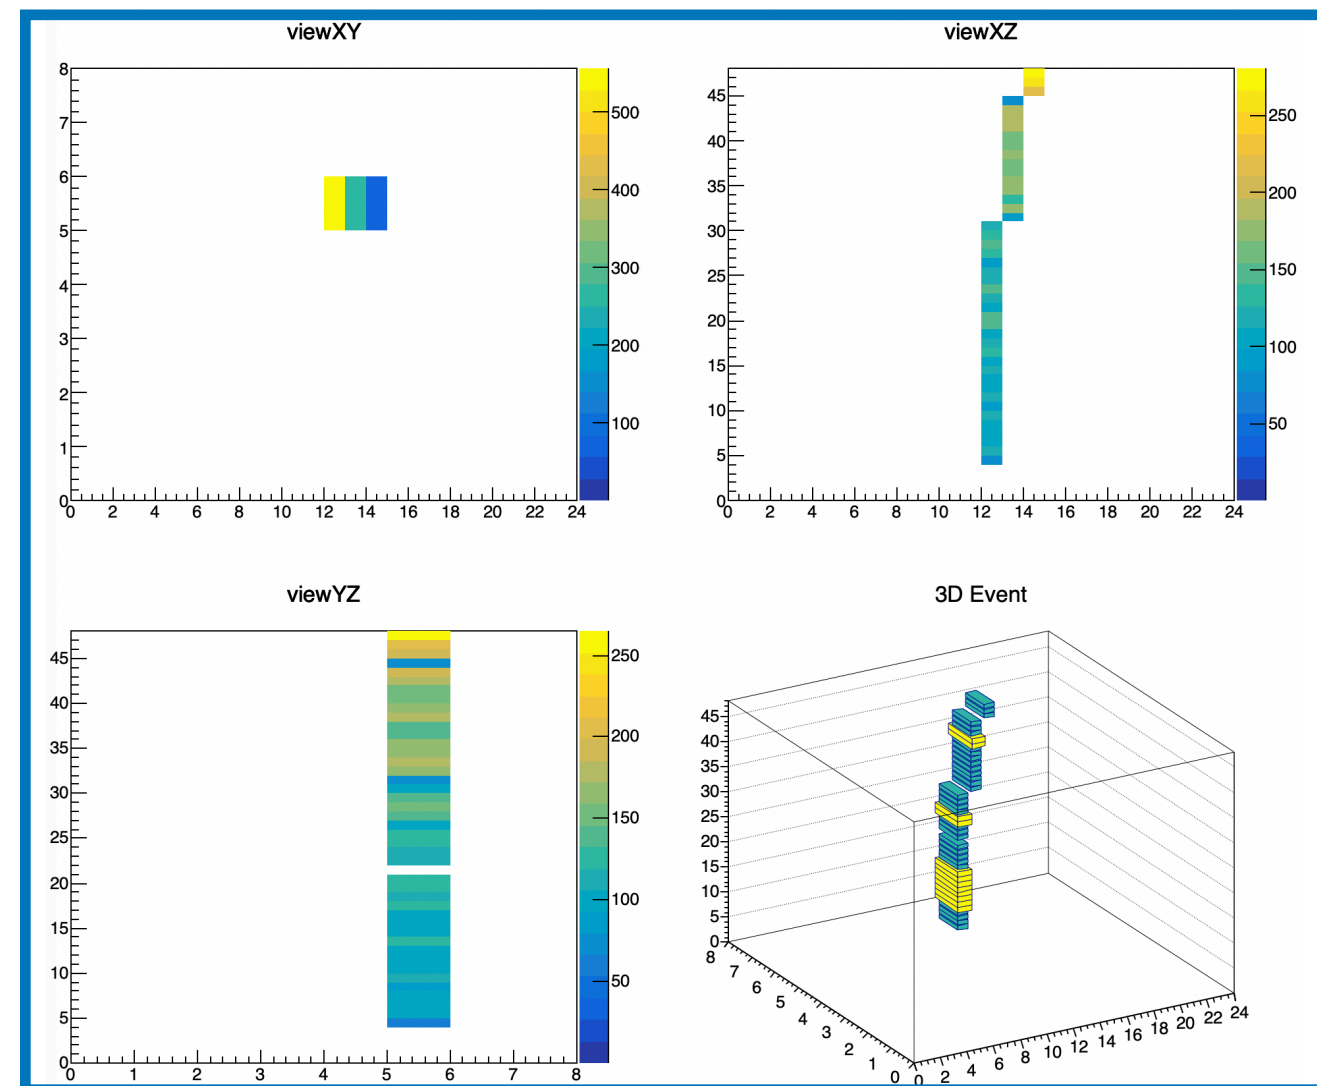

# PRESENT AND FUTURE

Merging all hits in viewXY! (to do reduce the combinatorics)

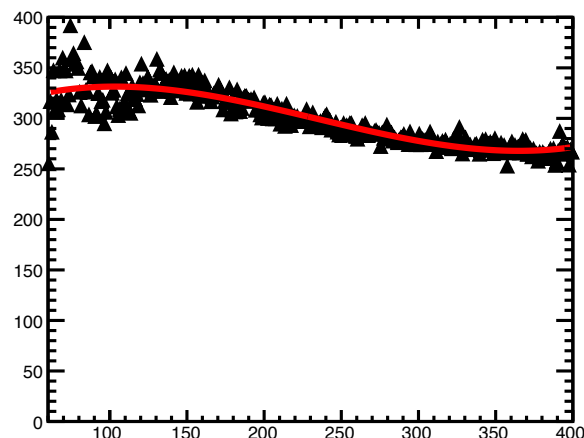

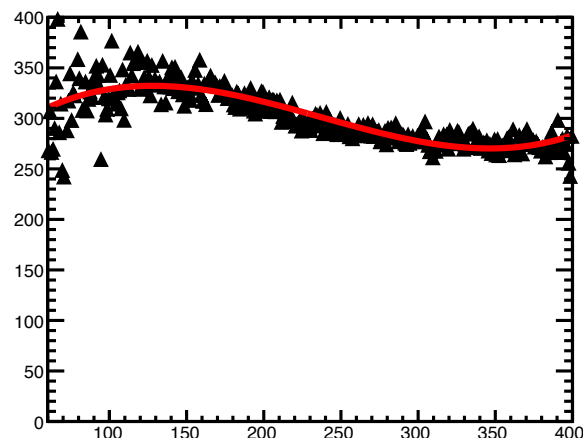

While merging... true information is 'lost'... in a similar way that happens in real detector  
what to store?

Taking advantage of the test beam prior knowledge on the beam directionality.

Numerical condition?

Mean charge (using cosμics)

Distance (a.u)

## ATTENUATION CORRECTION

	Att Coef	Coef Err	CorrFactor
Pr1	466,8	45,78	1,203
Pr2	465,4	45,78	1,079
Pr3	468,5	48,43	1,032
Ele1	434,1	39,73	1,220
Ele2	506,4	55,32	1,072
Ele3	477,4	52,40	1,031
Pi1	337,3	25,21	1,291
Pi2	505,1	54,27	1,072
Pi3	505,1	49,67	1,029

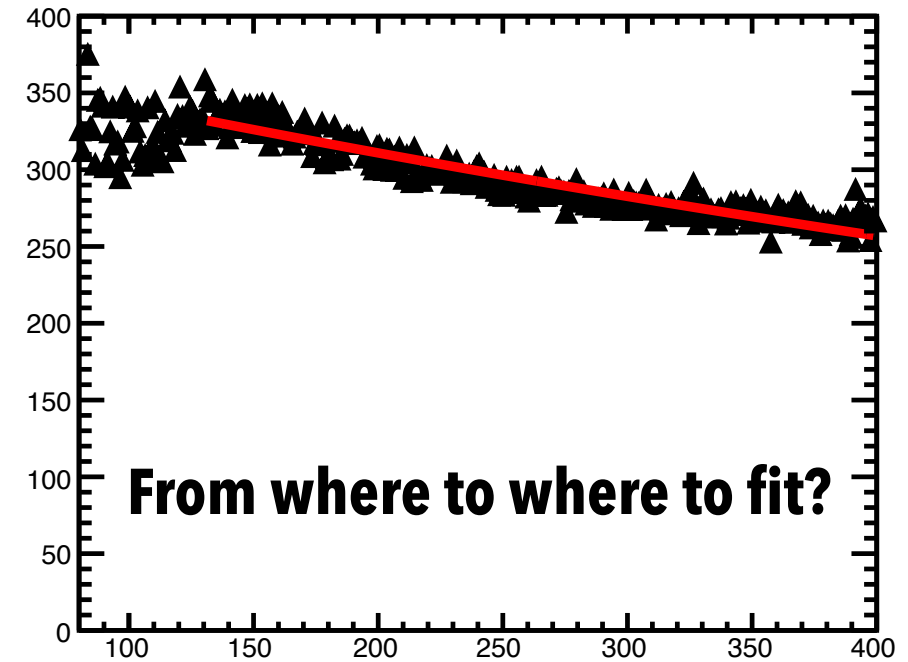

$$Data_{meas} = Data_{real} \times e^{-\left(\frac{Pos}{Att}\right)}$$

$$Data_{corr} = Data_{meas} \times e^{\left(\frac{Pos}{Att}\right)} \longrightarrow CorrFactor = e^{\left(\frac{Pos}{Att}\right)}$$

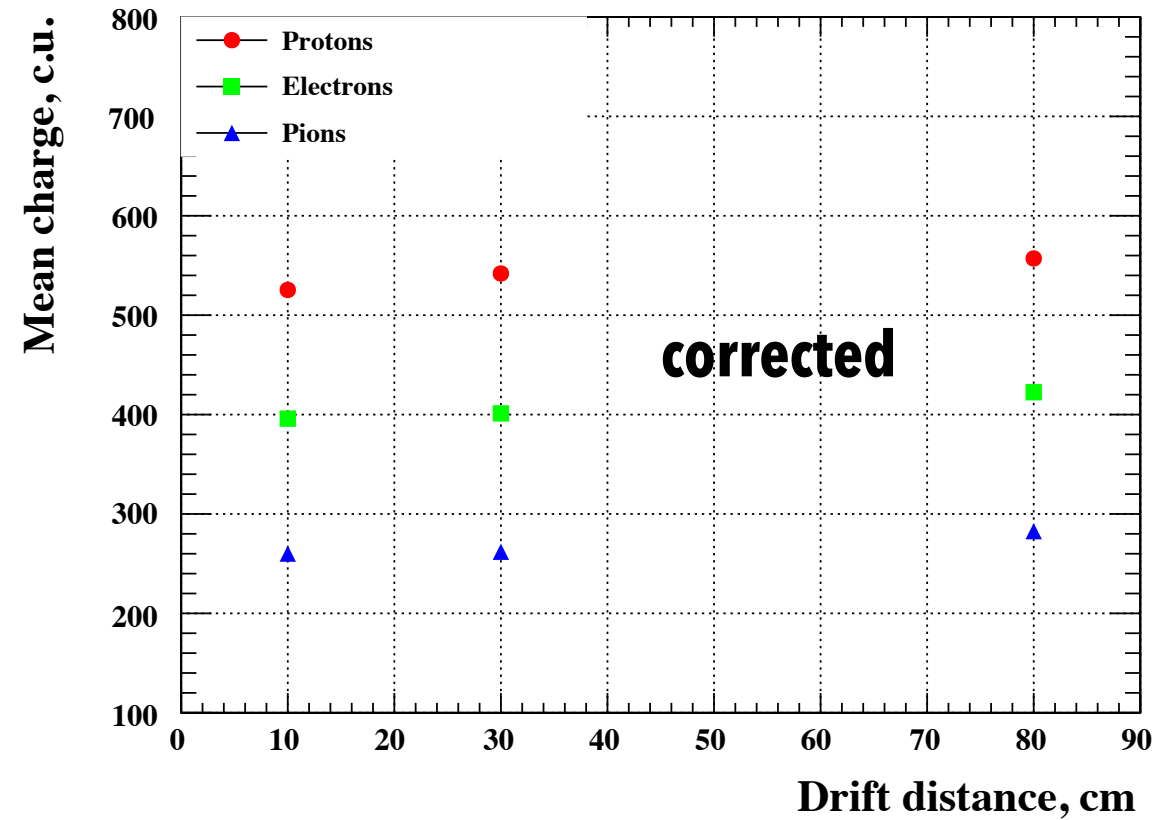

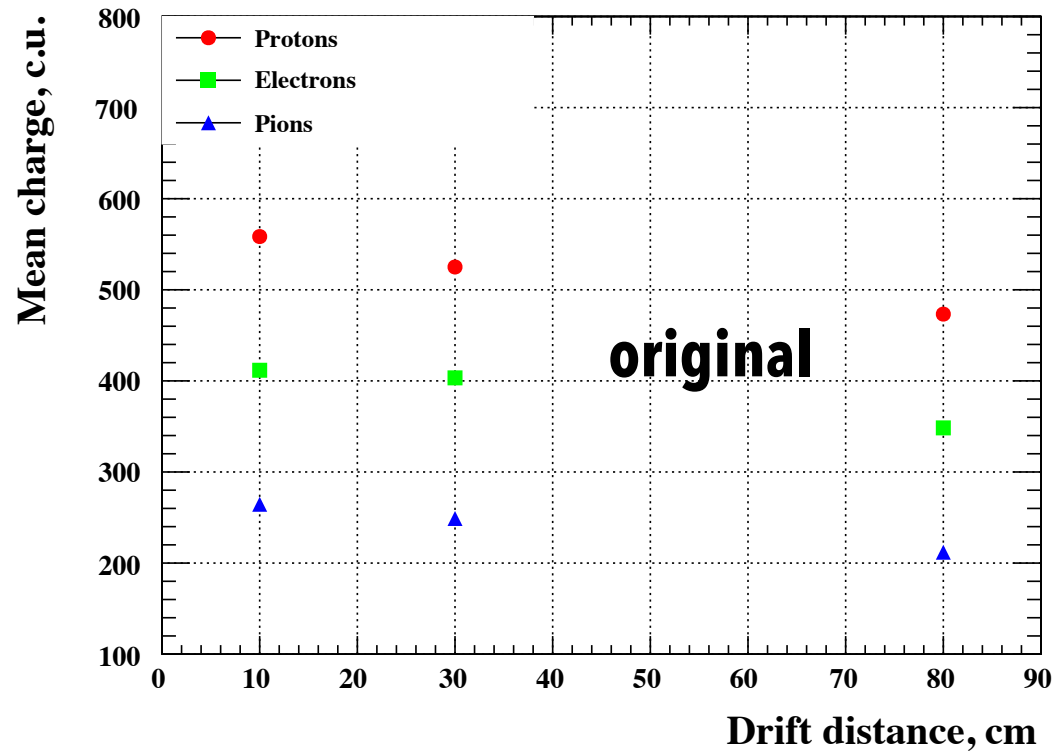

**(130,400)**

**(200,380)**

1,224	1,17
1,079	1,07
1,032	1,02
1,220	1,18
1,072	1,05
1,031	1,03
1,291	1,23
1,072	1,06
1,029	1,03

## Why this is annoying:

Pos Calc	
87,42	
36,38	
16,30	
85,86	
34,88	
13,89	
85,19	
34,51	
13,56	
86,15	1,14
35,25	0,99
14,58	1,50

**Positions deviate coherently.  
This is not the origin...**

**Gain correction is minor....**

**We need a huge difference in the attenuation to explain it...**
